MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., MARCH, 1923. NO. 3.

GENERAL SUMMARY.

March, 1923, in Missouri, was cold, wet, and stormy. Notwithstanding these rather marked and unpleasant features, the sunshine, 61 per cent of the possible, was a mitigating element from the side of personal comfort. It is also true that this last element was in most evidence only during the last 6 or 8 days of the month. Real winter weather prevailed on the 18th, and 19th. On the former date snow with strong winds prevailed all day, along with steadily falling temperatures. Morning thermometer readings of the 19th ranged from 11° below zero in the northern counties to 10° above in the extreme southeast counties. At many stations readings were the lowest of record for so late in March. The 24-hour falls ranged from 45° to 65°.

More or less damaging storms occurred on several dates. Blizzard-like weather prevailed in northern sections on the 18th, and particularly on the northern border, where snow drifted three feet deep in places. Traffic was interfered with a short time.

The weather was unfavorable for vegetation. Winter wheat continued in fair to good condition but made little growth. Peach buds were seriously killed by the freeze of the 19th. Some clover, alfalfa, and oats were cut down Much plowing had been done in the winter, and seeding oats made good progress during the last week of March.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 71 stations, was 40.4°. The mean departure from the normal for 68 stations having 10 or more years' record was minus 3.1°. This is the first minus departure since 1915. Temperatures alternated above and below normal frequently, the colder periods being somewhat more prolonged than the milder ones. The first three days were the mildest of the month, particularly the afternoons. The 18th and 19th were the coldest days. The 19th was a real winter day; on this date morning thermometer readings ranged from 11°, 10°, 7°, and 6° below zero, respectively, at Grant City, Bethany, Unionville, and Downing, to 10° above zero in the extreme Southeast. Zero readings occurred at 32 stations. This probably was colder than any day during the winter. There were other cold days, 15° above zero on the 31st, being unusual for so late in the season.

PRECIPITATION.

The average precipitation for the State, 89 stations reporting, was 4.12 inches. The mean departure from the normal for 83 stations having 10 or more years' record was plus 1 00 inch. In the northeast plain, southeast lowlands, and southwest plain the excess was more than one inch; in the Ozark region and northwest plateau the excess was .18 inch and 70 inch, respectively. From the 3d to the 16th there was rain or snow almost every day, the periods 5th-6th, 9th-13th, and 15th-16th being the ones of the most general precipitation. The heaviest rains, generally more than two inches, fell on the 11th. The greatest monthly amount was 8.30 inches, at Poplar Bluff. There was no precipitation during the last week.

There was almost no snow south of the Missouri River, except in the southwest plain. North of the river snow was heavier than any during the winter, and the heaviest in March since 1918. In fact the fall at one or two stations this month exceeded all other records for March. Along the immediate northern border amounts ranged from about 6 to 17 inches. Most of the snow fell on the 12th, and 18th. It remained on the ground a few days.

WIND.

The prevailing winds were from the southwest. The average movement, 8 stations equipped with anemometers reporting, was 9,450 miles, or about 19 per cent above normal. Winds of 35 miles an hour prevailed on the 3rd, 11th, and 15th. Some of these storms had the associated features of the tornado. See Special Storm Notes.

SUNSHINE AND CLOUDINESS.

There were 14 clear days The average number of hours of sunshine, 6 well selected stations equipped with sunshine recorders reporting, was 226. This is about 61 per cent of the possible, about 11 per cent above normal, and 19 per cent more than March, 1922.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---On the 11th, at St. Louis. In the extreme Southeast on the 6th, and 7th.

Hail.---3d, 12th, 14th, 15th, and 22d.

Halos, solar.---4th, 7th, 10th, 14th, 16th, 20th, 26th, 27th, and 28th.

Halos, lunar.---1st, 2d, 4th, 27th, and 29th.

Sleet.---10th, 11th, 14th, 15th, and 22d.

Thunderstorms.---3d, 9th, and 22d. More or less general and severe on the 11th, and 15th.

SPECIAL STORM NOTES.

March 3.—A funnel-shaped cloud extending to the ground, originating in Kansas, crossed the Missouri River at St. Joseph at about 5.33 p. m. On the Missouri side of the river the width of the path was about 200 feet. At the Weather Bureau observatory, about three-fourths of a mile from the nearest point in the path, the wind reached 60 miles an hour from the west at 5.40 p. m. Nine persons were injured but none killed. The property damage was estimated to be about $50,000.

March 5.—A strong wind, accompanied by considerable rainfall, caused about $3,000 damage to farm homes and other buildings west of Palmyra, Marion County, at about 9 p. m. There was some evidence of rotary winds. The path of damage was about one hundred yards wide. No person was killed or injured.

March 11.- At Jackson, Cape Girardeau County, a storm having marked features of a tornado passed over the town at 7.45 p. m. The path was about six miles long and 225 yards wide. There was considerable evidence of rotary winds though the funnel-shaped cloud was not observed, owing probably to darkness. Two persons were injured but none killed. The estimated damage is put at about $50,000. At 10 p. m. same date, a storm closely approximating tornadic force passed over the town of Farmington, St. Francois County. About the same time high winds occurred in Mississippi County, and at Caruthersville, Poplar Bluff, and Doniphan. A velocity of 64 miles an hour was recorded at St. Louis. The reported damage was small, about $3,000.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing: for example, [b] represents two days, etc.

† Also on other dates. †† Received too late to be included in means and summaries ‡‡ Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D., No. 5.

Daily Precipitation for March, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., APRIL, 1923. No. 4.

GENERAL SUMMARY.

The average weather elements of April, 1923, in Missouri, did not vary much from the usual. The rather cold weather at the end of March overlapped the first few days of April, but there was a reaction to more seasonable weather on the 6th. During most of the month temperatures fluctuated above and below normal for two, three and four days at a time. There were no freezing temperatures, as a rule, after the 17th. During the last ten days afternoon temperatures ranged above 80° on a few dates.

Showers were frequent, but as a rule light to moderate. Soil moisture was sufficient for present needs. There were no damaging hail, winds, or floods.

The month's weather was favorable for farm work. Wheat and grasses did well. There being no very warm weather at any time, fruits of all kinds made satisfactory progress. Some peach buds escaped the freeze of March 19th.

TEMPERATURE.

The monthly mean temperature for the State, 70 stations reporting, was 54.2°. The departure from the normal for 67 stations having 10 or more years' record was minus 0.6°. The northeastern plain was cooler than the other divisions. Cool spells prevailed from the 1st to the 5th, 8th to the 10th, and 14th to the 18th. The 1st, 4th, and 8th were the coldest days. Afternoon temperatures were above 70° three days during the first decade, three the second decade, and six during the third; they reached 80° or higher on the 19th, 23d, and 26th. There was an average of five nights with 32° or lower.

PRECIPITATION.

The average precipitation for the State, 88 stations reporting, was 3.12 inches. The departure from the normal for 82 stations having 10 or more years' record was minus 0.74 inch. The deficiency was somewhat greater in the northeast plain than in the other divisions, and there was a small excess in the southeastern lowlands. On the whole, the precipitation was uniformly distributed and sufficient for present needs. Light showers fell almost daily in some parts of the State. The more general and heavier rains occurring from the 2d to the 5th, 13th-14th, and 20th to the 24th. The heaviest monthly amount was 6.08 inches, at Poplar Bluff. The heaviest 24-hour amount fell at Columbia, on the 23rd-24th.

A heavy snow fell on the 5th, extending from Columbia northeast to Louisiana and Hannibal. The heaviest amount, 6.5 inches, fell at Palmyra, Marion County. Local falls of from 2 to 3 inches also fell at a few of the central-western stations. The snow soon melted.

WIND.

The prevailing winds were from the south. The total number of miles, 8 stations equipped with anemometers reporting, was 7,856, 10.9 miles an hour and about 10 per cent above the average. Fresh to strong winds prevailed on the 7th, and 21st.

SUNSHINE AND CLOUDINESS.

There were 14 clear days. The average number of hours of sunshine, 6 well-placed stations equipped with sunshine recorders reporting, was 234. This is about 59 per cent of the possible and about normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—On the 17th.

Frosts, heavy.—6th, 9th, 10th, 17th, and 18th.

Frosts, killing.—1st, 5th, 8th, 16th, and 17th.

Hail.—3d, 4th, 13th, 22d, 23d, and 24th.

Halos, solar.—2d, 7th, 12th, 16th, 17th, 22d, 25th, 26th, 27th, and 28th.

Halos, lunar.—1st, 25th, 27th, and 30th.

Thunderstorms.—2d, 3d, 4th, 5th, 7th, 13th, 20th, 21st, 22d, 23d, 24th, and 27th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for April, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., MAY, 1923. No. 5.

GENERAL SUMMARY.

The first week of May and the last four or five days averaged warmer than normal, but the rest of the month was mainly cool. On most of these days the averages were within 3° or 4° of normal, but there were several real cold days when the average warmth did not equal the usual by from 9° to 15°. The last three or four days, however, were distinctly warm and summer-like. Along about the 8th to the 10th a cool wave overspread the State, resulting in general frost, and freezing temperatemperatures at about 30 stations.

During the first week precipitation was light and local, but was frequent and general during the remainder of the month. Heavy to excessive rains fell in the Southeast, parts of the Ozark Plateau, and in few of the southwestern counties. Though frequent elsewhere, the monthly totals were considerably less than the usual May rainfall, although quite sufficient for present needs.

While conditions varied in parts of the State, the month's weather was unfavorable for farm work and crop growth, that is, too cool generally and too wet locally. Wheat, though, kept a fair to good condition and made satisfactory development. Peaches, as a commercial crop, were killed by the freeze. Other fruits did well.

TEMPERATURE.

The monthly mean temperature for the State, 71 stations reporting, was 62.7°. The departure from the normal for 68 stations having 10 or more years' record was minus 1.9°. It was the coolest May since 1919. As a rule the first four days and last four days were warmer than normal, but cool unseasonable weather prevailed most of the time. A freeze occurred at 30 stations on the 9th, and at several stations in the extreme Southeast on the 10th. Owing to the backward condition of vegetation there was not much damage. The lowest temperature was 25°, at Dean, McDonald County on the 9th. The highest was 97°, at Caruthersville, Pemiscot County on the 31st.

PRECIPITATION.

The average precipitation for the State, 87 stations reporting, was 4.59 inches. The departure from the normal for 81 stations having 10 or more years' record was minus 0.49 inch. The precipitation was unevenly distributed, there being a large excess in the southeastern low lands and portions of the Ozark Plateau, and comparatively marked deficiencies in the other three divisions, except in the extreme southwest part of the southwestern plain. Excessive precipitation was rather general on the 10th and 11th, and inthe South east on the 15th, but most of the rains were light though frequent and general. At a few places in the Southwest and Southeast local down-pours caused damage to crops and other property. The greatest local monthly amount was 11.31 inches, at Jackson; and the greatest amount in any twenty-four hours was 3.48 inches, at Jackson on the 15th.

A flurry of snow occurred at 18 stations, in the central and northern sections, on the 8th, but only one place, the University of St. Louis, reported a measurable amount, 0.1 inch. Snow flurries are not infrequent during the first part of May. Only once, though, in the past 30 years or more has a real snowstorm occurred, and that was in May, 1907.

WIND.

The prevailing winds were from the southeast. The average wind movement was 7,105 miles, based on the records of 8 stations equipped with anemometers. The average velocity was 9.6 miles, or slightly more than normal. A few local damaging winds occurred.

SUNSHINE AND CLOUDINESS.

The average number of clear days was 11, 3 less than last May. The average number of hours of sunshine was 266, or about 60 per cent of the possible and about 3 per cent less than normal. There was about 10 per cent more sunshine in the northwest section than in other sections.

MISCELLANEOUS PHENOMENA.

Fog, dense.---At Kansas City on the 28th.

Frost, light.---9th, 10th, 13th, and 17th.

Frost, heavy and killing locally.---On 9th, and 10th.

Hail.---11th, at Neosho, and St. Catharine.

Halos, solar.---1st, 2d, 4th, 5th, 6th, 7th, 10th, 13th, 21st, 23d, 26th, and 30th.

Halos, lunar.---31st.

Thunderstorms.---2d, 3d, 7th, 10th, 11th, 12th, 14th, 15th, 18th, 19th, 20th, 23d, 24th, 25th, 26th, 27th, 28th, 29th, 30th, and 31st.

SPECIAL STORM NOTES.

Neosho.---A thunderstorm attended by wind, heavy rain, and severe hail, occurred at and in the vicinity of Neosho, Newton County, 8 p. m. to 9 p. m. May 11. The storm extended from about 12 miles west to 15 miles east of Neosho. The width was about 4 1-2 miles. The movement was from west to east. Hailstones varied between the size of playing marbles to 6 1-2 inches in circumference. On open ground nearly 2 inches deep, and in drifts of 8 inches. Toward north exposures the stones remained unmelted for 48 hours. Some roofs of houses were punctured by hail, and many automobiles damaged. Wire poles and some trees were blown down. Damage to property, including crops, the heaviest being to tree fruits and strawberries, was conservatively estimated at $300,000.

Warrenton.---A small local whirlwind occurred just southeast of this town about 3 p. m. May 26th. The movement was from east to west, contrary to the usual course of these storms. The path was only a few yards wide, and a few hundreds long. A few outhouses lying in the path were damaged. The total loss was small.

Lockwood.---A severe thunderstorm, attended by excessive rain, some hail, and high wind occurred about 7.30 p. m. May 11th. There were railroad washouts, and some other damage.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for May, 1923.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. ‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. T. Trace, or less than 0.01 inch.
*** Regular U. S. Weather Bureau station; precipitation is for 24-hour period, midnight to midnight. ** Precipitation in the next following measurement; separate dates of fall not recorded.

Daily Temperatures for May, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., JUNE, 1923. No. 6.

GENERAL SUMMARY.

June, 1923, in Missouri, did not differ materially from the usual in its temperature distribution, but there was somewhat more cloudiness and rain, and a little more wind than is allotted to a normal June. The cloudiness, however, was more in evidence during the first 12 or 15 days. Four well defined relatively cool and warm spells alternated during the month. The most pronounced warm spell lasted from about the 16th to the 26th. This spell was favorable for the agricultural interests, but, because of the rather moist condition of the air along with the excess heat, caused some suffering from the side of personal comfort, particularly in the larger cities. The last four days, though, was an abrupt and marked reversal to cool, pleasant weather.

The first half of the month was rather too wet for best farm results. During the last ten days farm work was mostly favored, and cultivation, growth, and development were satisfactory. At the close of the month wheat harvest was well along, and corn was in good condition.

Local rain, hail, and wind caused some relatively small crop damage.

TEMPERATURE.

The monthly mean temperature for the State, as determined from the records of 69 stations, was 73.5°. The departure from the normal for 66 stations having 10 or more years' record was plus 0.2°. Temperatures were uniformly distributed, no section varying much from another. The first four days were slightly warmer than normal, followed by a slightly cooler week; from the 16th to about the 26th was the warmest spell of the month, the daily excess averaging 4° or 5°. The last four days were relatively cool and pleasant. Afternoon temperatures reached 90° or higher on 9 days, the 17th, 20th, 22d, and 26th being the most marked and general in this respect. Conception with 102°, Bethany with 100°, both on the 25th, and Caruthersville with 100° or higher on 5 days were the only instances of markedly high temperatures. Minimum temperatures were below 50° generally on the 29th, the lowest, 45°, being recorded at six stations. This value is uncommon for so late in June, although even a cooler spell prevailed in the last 10 days of June, 1902.

PRECIPITATION.

The average precipitation for the State, 86 stations reporting, was 5.48 inches. The departure from the normal for 80 stations having 10 or more years' record was plus 1.02 inches. The moisture was quite evenly distributed, the wettest section being in the southwestern plain. Rains were more or less general from the 2d to the 7th, 9th to 12th, 15th, and 27th to 29th. As a rule the heaviest falls occurred on the 10-11th, and 27-28th, though some heavy amounts fell in the northwest and north-central sections on the 1st-2d. The greatest monthly precipitation was 9.36 inches at Nevada. The greatest amount in any 24 consecutive hours was 4.42 inches, at Nevada on the 8-9th. Other excessive amounts fell as follows: Avalon, 3.50 inches, on the 1st; Fayette, 3.17 inches, Clifton Hill, 2.70 inches, Waverly, 4.03 inches, on the 2d; Lockwood, 3.02 inches, on the 9th, Amoret, 4.35 inches, Warrensburg, 3.27 inches, on the 11th; Liberty, 3.06 inches, on the 15th; Boonville, 2.50 inches, Mexico, 2.65 inches, on the 27th.

WIND.

The prevailing winds were from the south. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 5,782 miles, 7.9 miles per hour, and slightly more than normal. There were some strong local winds on the 4th, 6th, 15th, 18th, and 27th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 305 or about 68 per cent of the possible, and about 4 per cent less than normal. June in 1922 gave 77 per cent of the possible.

MISCELLANEOUS PHENOMENA.

Hail.---At Clifton Hill, and Springfield, on the 4th; Steffenville, 5th; Nevada, 8th; Hannibal, Mountain Grove, Warrensburg, 27th; Greenville, Liberty, 28th; Kansas City, 30th.

Halos, solar.---2d, 7th, 8th, 16th, 17th, 19th, 26th, 27th, and 30th.

Thunderstorms.---Every day from 1st to 11th, mostly thundershowers, but more or less general on 4th, 5th, and 6th, on 14th, 15th, and 17th to 20th, 24th to 28th, and 30th, with most general on 27th.

SPECIAL STORM NOTES.

Nevada.---During the evening and early night of the 8th a severe rain and hail storm occurred at Nevada, Mo. The rain began about 7.20 p. m. and by about 9 p. m. 3.90 inches had fallen. Hail fell from about 7.45 p. m. to 8.10 p. m. and varied in size "from that of a small pea to that of a hen's egg." Automobiles suffered, tops being pierced and windshields broken. Greenhouses were damaged, and other glass broken. Shade and some fruit trees were nearly stripped of leaves and fruit. Swollen streams flooded some lowlands. The storm was confined to the vicinity, extending from about one mile west to about the same distance east. The hail fell within the city proper. Loss considerable, but no estimate made.

Jackson.---A terrific windstorm at 9 p. m. the 27th. There was considerable damage to corn and fruit.

Lockwood.---A bad storm of thunder and wind occurred on the 28th; considerable damage nearby, and some in town.

Liberty.---On the 28th hail did a great deal of damage to crops in some parts of this county.

Tarkio.---During the night of the 27th, a severe hail and wind storm badly damaged crops nine miles northwest.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Correction for Climatological Data for May, 1923: Warsaw, partly cloudy days, 20; cloudy days, 6.

Daily Precipitation for June, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXVII. Columbia, Mo., July, 1923. No. 7.

GENERAL SUMMARY.

July, 1923, in Missouri, was warmer and drier than normal in all sections, though both temperature and moisture departures were of relatively small value. Positive temperature departures were, as a rule, the result of rather high night than high day temperatures, there being but two or three stations in each section, outside of the southeast part of the State, with maxima of 100° or higher. The greater part of the month, and particularly the first and last weeks, were pleasant from the side of personal comfort.

At the close of the month farm work was well up to the average, and condition of the main crops were average or higher. Aside from some storm damage in the southwestern part of the State on the 29th, the month was free from severe storms.

TEMPERATURE.

The monthly mean temperature for the State, 69 stations reporting, was 78.2°. The departure from the normal for 66 stations having 10 or more years' record was plus 0.7°. The temperature distribution was uniform, the southeastern lowlands being a bit warmer than elsewhere. The first four days were cooler than normal, the following week was warmer than normal; from about the 12th to the 25th, temperatures varied every few days, sometimes a few degrees above and again a few degrees below normal; the last 6 days were mainly pleasant. Maxima were 90° or higher on about 18 days; afternoon values were near the 100° value generally on the 10th, and 24th.

PRECIPITATION.

The average precipitation for the State, 93 stations reporting, was 3.07 inches. The departure from the normal for 82 stations having 10 or more years' record was minus 0.89 inch. The rainfall was less than normal in all divisions, but the deficiency was much more marked in the eastern half of the State, and especially the eastern-third. The more general rains fell on the 4th, 12th, 14th, and 27th,28th or 30th. The greatest monthly amount was 10.29 inches, at Waverly, and the next greatest was 7.07 inches, at Amoret. The greatest amount in any 24 consecutive hours was 7.42 inches, at Waverly. (Waverly is a river station, not entered on Climatological page, but on Precipitation page.) Other heavy 24-hour amounts were, 2.70 inches at Jefferson City, on the 15-16th; 3.08 inches, at Seymour on the 13th, and 4.25 inches, at Marshall on the 4th. At Rolla, 3 inches fell in about one hour on the 15th.

WIND.

The prevailing winds were from the south. The average movement based on records of 8 well placed stations equipped with anemometers, was 4,562 miles, 6.1 miles per hour, and about 15 per cent less than normal. There were a few high winds, resulting damage being confined to small areas.

SUNSHINE AND CLOUDINESS.

The average number of hours of of sunshine for the State, based upon the records of 6 stations equipped with sunshine recorders, was 346, or about 76 per cent of the possible and about 5 per cent above the normal.

MISCELLANEOUS PHENOMENA.

Hail.---Locally damaging in Jasper, Newton, and Barry Counties on the 29th, and in Wright County on the 30th.

Halos, solar.---3d, 4th, 13th, 23d, and 26th.

Halos, lunar.---On the 25th.

Thunderstorms.---More or less general on the 3d, 4th, 5th, 11th, 15th, 27th, and 29th.

SPECIAL STORM NOTES.

July 29th.---During the evening and night a severe thunderstorm, accompanied by hail and wind, swept a path three to four miles wide across Jasper County, eastern parts of Newton and McDonald Counties, and the western part of Barry County. While the severity of the storm was much less at some places than at others, there were several localities that got the full force of the storm, resulting in heavy damage, principally farm crops including orchards. The storm traveled from northwest to southeast, though dipping southward in parts of its path. The hail was most severe in Jasper and Newton Counties. Some of the stones were six inches in circumference. Several large barns were demolished, houses and small buildings unroofed, and hundreds of window panes were broken on the northern and western sides. One of the heaviest items of property damage was to furnishings of homes, and stocks of goods of business firms, due to penetration of roofs by hailstones, letting in a flood of rain which was a feature of the storm. Newspapers of the storm's vicinity place the damage to property and crops at $300,000, as the lowest estimate. In Barry County fruit was whipped from the trees, and some buildings were moved from foundations while others were blown inward.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for July, 1923.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., AUGUST, 1923. No. 8.

GENERAL SUMMARY.

August, 1923, in Missouri, was a month of nearly average summer weather, without notable feature, save perhaps the more than usually irregular distribution of rainfall, and a cool snap during the first part of the last decade. Drought was rather persistent in most of the Ozark Plateau and southwestern plain, while in most of the northern part of the State the month was wetter than usual. Heat was somewhat more noticeable in southern sections, the result of relatively scanty rainfall and excess sunshine.

Temperature changes from day to day were not of marked importance. Afternoon temperatures reached and exceeded the 100° value on four or five days. A well marked cool wave overspread the State on the 22-23d. Early morning temperatures were in the 40's generally, 42°, in the northern border counties being the minimum. There were some hearsay reports of frost, but no official or reliable information.

There was sufficient moisture for farming interests most of the time in all sections, except the Ozarks, and the lower part of the southwestern plain. In several of the extreme southwestern counties there was hardly any rain at all. Except in this dry section the month was favorable for crops, corn being better than usual.

Thundershowers were frequent, but there were few squalls. There was no hail damage.

TEMPERATURE.

The montlhy mean temperature for the State as a whole, 68 stations reporting, was 77.3°. The departure from the normal for 65 stations having 10 or more years' record was plus 1.3°. The excess warmth was quite marked in the southern sections, but was not noticeable in the northwestern plateau and northeast plain. During the first half of the month temperatures were above normal almost daily, but during the latter half the warmth varied a few degrees below normal every few days. The hot days were 4th, 5th, 11th, and 14th, the 11th being the hottest generally. About 32 stations had afternoon readings of 100° or higher, the highest being 108°, at Hollister, Taney County, where drought was persistent. An unusually cool spell prevailed on the 22d, and 23d, when minima ranged in the 40's, 42°, being the lowest. As compared with other years, the current cool spell did not quite equal similar cool spells of August, 1891 and 1915.

PRECIPITATION.

The average precipitation for the State, 94 stations reporting, was 3.99 inches. The departure from the normal for 76 stations having 10 or more years' record was plus 0.31 inch. Rains were unevenly distributed geographically. There was a marked excess in the northeastern plain, a small excess in the northwestern plateau, and deficiency elsewhere. In most of the Ozarks and southwestern plain it was noticeably dry, rain falling on from 1 to 3 days only, and generally light. In northern sections there were from 12 to 15 days with rain. The greatest amount that fell in any 24 consecutive hours was 5.25 inches, at Avalon, on the 8-9th. The next excessive amounts were 3.66 inches at Patton, and 3.46 inches at St. Louis. At St. Catharine the monthly fall was 9.55 inches, while at Neosho only 0.24 inch fell.

WIND.

The prevailing winds were from the southwest. The average movement, based upon records of 8 well placed stations equipped with anemometers, was 5,060 miles, or about 6.8 miles an hour, and about normal. There were a few thunderstorm squalls.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, six well placed stations equipped with sunshine recorders reporting, was 290, or 68 per cent of the possible and about 3 per cent less than normal. The current month had about 6 per cent less sunshine than the same month in 1922.

MISCELLANEOUS PHENOMENA.

Fogs.---At St. Louis on the 3d; St. Joseph on the 18th; in southeast Missouri on the 24th, and 29th.

Hail.---Small, at St. Louis University, and Amoret, on the 5th; Greenville on the 6th.

Thunderstorms.---On the 3d, 4th, 5th, 6th, 8th, 9th, 14th, 15th, 16th, 21st, 26th, and 27th. Thundershowers, or thunder heard almost daily in some part of the State.

ERRATA.

In the report for July, 1923, pages 26 and 28, Kansas City, the minimum temperature on the 27th should be 70; mean monthly minimum, 71.1; mean monthly temperature, 79.3.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for August, 1923.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., SEPTEMBER, 1923. No. 9.

GENERAL SUMMARY.

There was nothing of special interest about the weather elements of September, 1923, in Missouri. Temperatures differed but little from the usual, but there was more cloudiness and more rain than ordinarily, the last element being more pronounced over the western half of the State than in the other sections.

A cool wave overspread the State about the middle of the month, resulting in quite a sudden change from summer warmth to autumn values. There was a light frost deposit at a few stations along the northern border on the fourteenth, but there was no apparent damage to vegetation. This change to colder weather so early in the month was somewhat out of the usual, but other Septembers show cool spells along about the middle of the month. The date of earliest freezing temperature in about 36 years is September 18th (1901).

The general conditions were favorable for farming interests. At the close of the month 85 per cent of the corn crop was fully matured or safe from frost damage. Wheat seeding was going forward rapidly.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 73 stations, was 68.7°, or practically normal as compared with the average of 36 years' record. The temperature distribution was quite uniform, the variations above and below the normal in the five divisions being less than 1°. As compared with other Septembers the present month is the coolest since 1918. The first five and the last seven days of the month were the warmest, and during both periods the afternoon temperatures ranged around and above 90° on one or more days. Generally the coolest period prevailed from about the 13th to the 16th, when the minima ranged from about 45° down to 33°, the latter occurring on the 14th. Frost, resulting in little or no damage, was observed in low places along the northern border.

PRECIPITATION.

The average precipitation for the State, based upon the records of 95 stations, was 4.47 inches. The departure from the 56 years' average was plus 0.74 inch. The western half of the State was wetter than the eastern half, the rainfall over the latter being nearly normal while over the former the normal was considerably exceeded; excessive rainfall, however, was confined to a few counties, namely, Jackson, Pemiscot, Dade, Barton, Holt, Schuyler, and Scotland. The rain spells were well defined and occurred at quite regular intervals, the 6-7th, 16th to the 20th, and the 27th probably being the most general. The greatest amount in any 24 consecutive hours was 5.26 inches, at Oregon, Holt County, on the 29-30th.

WIND.

The prevailing winds were from the southeast. The total wind movement, based upon the records of 8 stations equipped with anemometers was 5,330 miles, or an hourly velocity of 7.4 miles. This is about 7 per cent less than normal. There were no damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well-placed stations equipped with sunshine recorders reporting, was 215. This is about 58 per cent of the possible, and about 7 per cent less than normal. September, 1922, had 20 per cent more sunshine than the present month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---2d, 3d, 4th, 22d, 24th, 28th, and 29th, mostly along the Mississippi River north of St. Louis.

Frosts, light.---At a few of the most northern stations on the 14th, and 16th.

Hail.---At Kansas City, Lockwood, and Seymour on the 26th; at Oregon on the 28th. Stones small; no damage.

Halos, solar.---2d, 14th, 15th, 23d, 24th, 26th, 28th, and 29th.

Halos, lunar.---15th, 25th, and 26th.

Thunderstorms.---More or less general on the 1st, 5th, 6th, 11th. 26th, 27th, 29th, and 30th. Local thundershowers on other dates.

SPECIAL STORM NOTES.

Clinton.---There was a severe electrical storm on the 5th, with some high wind; and quite a severe thunderstorm on the 30th. No damage reported.

Seymour.---During a thunderstorm on the 26th, lightning struck and burned a barn on the S. E. Trimble Farm, about two and one-half miles northeast ot this place. Some feed, harness, a buggy, two calves, and one horse were lost.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for September, 1923.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., OCTOBER, 1923. No. 10.

GENERAL SUMMARY.

October, 1923, in Missouri, was the coldest since 1917, and the wettest since 1919. The excess moisture, however, was confined to sections south of the Missouri River as a rule. As compared with Octobers of the past five years, the present month was less pleasant from the physiological side. The sunshine, the one element that goes to make up ideal October weather, was lacking, while the dull, gray sky was most in evidence this year.

The first two weeks were more or less mild, several days being quite summer-like, with afternoon temperatures hovering around the 80° value. The latter half of the month was colder than normal, though the first killing frost and freeze did not occur until about the 20th. Some apples were frozen, but otherwise all farm crops and vegetation in general had fully matured, and no damage resulted.

Notwithstanding rather frequent rainy spells, seasonal farm work made fair progress. Winter wheat seeding was completed, save in a few localities, more especially in the southwest counties, where most of the month was gloomy. Pastures continued green and plentiful.

A slight earthquake shock was felt at Poplar Bluff at about 11 a. m. of the 28th. The month was free from damaging storms of any kind.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 53.0°. This is 4.4° lower than the 36-year average, and the first negative departure from the normal since 1917. Temperatures were remarkably uniform, negative departures occurring at all stations with averages varying from nearly 3° in the southeastern lowlands to more than 4° in all other divisions. The first 10 or 12 days of the month were mostly mild, with some very pleasant days, the 1st, 9th, 10th, and 11th being summer-like; the latter half of the month was persistently cooler than normal. The first killing frost and freeze occurred on the 19th, 20th, and 21st, progressing from north to south; the lowest temperatures and hardest freeze, however, occurred on the 31st, which probably also was the coldest October day since 1917.

PRECIPITATION.

The average precipitation for the State, based upon the records of 107 stations, was 3.39 inches. The departure from the 56 years' average was plus 0.64 inch. The precipitation was unevenly distributed, being rather excessive in sections south of the Missouri River, and normal or below normal north of that line. Monthly amounts ranged from more than 9 inches in the extreme southwest to less than one inch in the extreme northeast. The more or less general rainy spells were the 1st, 4th, 12th-13th, 16th-18th, and 26th-30th. The greatest amount in any 24 consecutive hours was 2.76 inches, at Neosho on the 13th.

There was one flurry of snow, on the 29th; along the northern border amounts varied between 1 and 3 inches at six stations, and a trace occurred at a number of other stations in northern sections.

WIND.

The prevailing winds were from the northwest and north. The average monthly movement, 8 stations equipped with anemometers reporting, was 5,223 miles, or an hourly velocity or 7.0 miles. There were no gales or damaging winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 well placed stations equipped with sunshine recorders, was 203. This is about 59 per cent of the possible, and about 7 per cent below normal, 9 per cent less than in October, 1921, and 13 per cent less than the same month in 1922.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---14th, 15th, 21st, 24th, 28th, and 29th.
Frost, killing.---More or less general on the 20th and 21st.
Hail.---At Kansas City on the 26th.
Halos, solar.---1st, 2d, 3d, 5th, 6th, 11th, 14th, 15th, 19th, and 27th.
Halos, lunar.---19th.
Sleet.---At Springfield on the 26th.
Thunderstorms.---1st, 11th, 16th, 29th, and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for October, 1923.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., NOVEMBER, 1923. No. 11.

GENERAL SUMMARY.

The prevailing weather of November, 1923, in Missouri, was comparatively calm and settled, the usual type expected in this autumn month. The month opened cold but soon warmed up. Two other cold snaps, reminding one of winter, came along on the 8th, and 27-29th, but in each case there was a quick reaction to mild weather. The human body is particularly sensitive to moisture and wind, and we find that these two elements were below normal, while the sunshine and temperatures were practically normal. The month, consequently, was pleasant from the side of personal comfort. Aside from this, the one marked change and outstanding feature was a general and heavy snow on the 29th.

Precipitation prevailed for only a day or two at a time, and fell at intervals of eight or ten days, affording ample soil moisture for needs, at the same time the dry intervals were favorable for all outdoor work.

Pastures furnished good grazing and live stock kept in good condition at a minimum cost. Winter wheat stooled fairly well, the general condition being satisfactory at the close of the month.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 66 stations, was 45.1°, or 0.6° higher than the 36-year average. Temperatures were uniformly distributed, averages for the different divisions agreeing within small values. Generally the first and last ten days were variable, some days being a little warmer and others cooler than normal, but the remainder of the month was milder than normal, except the 16th. The 10th and 11th were the warmest days, afternoon maxima ranging between 75° and 80°. Probably the 1st, 8th, and 28th were the coldest days, 14° above zero being the minimum. There were 13 days with minimum temperature of 32° or lower.

PRECIPITATION.

The average precipitation for the State, 102 stations reporting, was 2.15 inches. The departure from the 56 years' average was minus 0.20 inch. Precipitation was quite uniformly distributed, falling on one or two days at a time at intervals of about ten days. The greatest monthly amount was 4.45 inches, at Parma, New Madrid County, and the least amount was 0.26 inch, at Oregon, Holt County. The greatest in any 24 consecutive hours was 2.30 inches, at Vanduser, Scott County, on the 3rd.

A general snowstorm occurred on the 29th, except in the southeast section and along the southern Ozark slope. Amounts over the western part of the State were unusually heavy, ranging from 7 to 10 inches. It melted rapidly, as the soil was relatively warm, and wet.

WIND.

The prevailing winds were from the southwest. The monthly movement, 8 stations equipped with anemometers reporting, was 6,032 miles. The average hourly velocity was 8.4 miles, and about 25 per cent less than normal. There were no high winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 182. This is about 61 per cent of the possible, and about 4 per cent more than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—9th, 13th, 14th, 15th, 22d, and 23d.
Halos, solar.—1st, 11th, 12th, 13th, 24th, 25th, and 27th.
Halos, lunar.—20th, 21st, 23rd, 25th, and 27th.
Sleet.—In southwest section on 25th and 29th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for November, 1923.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., DECEMBER, 1923. No. 12.

GENERAL SUMMARY.

December, 1923, was not only the fourth consecutive markedly mild December, but the warmest of the four, and the warmest of all other Decembers since 1889. Unless we include the last two days of the month there were no characteristic winter periods, no sudden drop in temperature, no high winds, almost no sleet or snow. The abrupt change, however, from spring-like weather to winter on the 30th, and 31st, was very marked from the physiological side.

From the economic side the prevailing weather was favorable, and yet unfavorable. Favorable from the viewpoint of the outdoor worker, the open winter grazing, minimum heating of homes, and general good health. On the other side, the business channels of fuel, heavy clothing, and transit feeds, lagged somewhat behind the normal.

Winter wheat made good root growth and kept a healthy color. The early sown was stooling fairly well. Owing to rather soft ground there still was considerable corn in the field.

TEMPERATURE.

The monthly mean temperature for the State, 69 stations reporting, was 41.0°, and 7.1° higher than the 36-year average. It is the fourth consecutive December with marked plus departures, and the warmest of all Decembers since 1889. Except an abrupt change to severe winter weather on the 30th, and 31st, mild conditions prevailed almost continuously. In all, about 26 days were warmer than normal. On the 8th, 9th, and 27th afternoon temperatures ranged into the 70's. The 31st was the coldest day, with a general cold wave, the 24-hour temperature fall ranging from 30° to 45° and to a minimum zero or 10° to 16° above zero.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 101 stations, was 3.06 inches. The departure from the 56 years' average was plus 1.03 inches, the greatest excess since 1918 for the State as a whole. By sections, the northwestern plateau received less than normal precipitation, the southwestern plain a little more than normal, while most of the Ozark Plateau and southeastern lowlands were much wetter than usual. The more or less better defined periods of precipitation embraced the 3-4th, 12-13th, 19th to 22d, and the 31st, the last being fine snow. The greatest monthly amount was 6.33 inches, at Parma, New Madrid County, and the least was 0.25 inch, at Conception, Nodaway County. The heaviest fall in any 24 consecutive hours was 2.23 inches, at Rolla on the 12th. Sleet and snow were of little consequence.

WIND.

The prevailing winds were from the southwest. The average monthly movement, 8 stations equipped with anemometers reporting, was 6,134 miles. The average hourly velocity was 9.7 miles. Brisk to strong winds occurred on two or three dates.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations reporting, was 137. This is about 47 per cent of the possible and approximates the normal for December. Last December was about 13 per cent brighter than this month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—On the 3d, 9th, 17th, 20th, 21st, 22d, 27th, and 30th.

Halos, solar.—1st, 2d, 6th, 7th, 11th, 13th, 14th, 15th, 18th, and 20th.

Halos, lunar.—1st, 13th, 14th, 15th, 17th, 18th, and 28th.

Sleet.—Light on the 13th, 30th, and 31st.

Thunderstorms.—Thunder heard at a few stations on the 9th and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for December, 1923.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVII. COLUMBIA, MO., YEAR, 1923. No. 13.

GENERAL SUMMARY.

The weather of the year 1923, in Missouri, did not differ much from the usual. There were no prolonged spells of extreme cold or heat, rain or drought. There were no river floods of consequence, and damage resulting from lightning, wind, and hail was limited to small, scattered local areas.

The more interesting and outstanding features of this otherwise placid year are here placed in review. Probably the persistent mild open weather of January, and December, and also of November caused most remark and made the more lasting impression. Mild winter months have considerable economic value for the people. The outdoors' worker is kept busy, there is open winter grazing, minimum heating of homes, and general good health. On the other side there usually is some complaint of sluggishness in the business channels of fuel, heavy clothing, and transit feeds. March weather was typical of the conditions commonly associated with this month; real winter weather prevailed on the 18th, and 19th. There was a general and marked cool wave on August 22d, and 23d, and another on September 13th to the 16th, the latter giving light frost temperatures in a few localities. While such marked temperature changes have occurred in other years along about the same dates, they are not common. More than one football hero went down to defeat because of the general and heavy snowstorm on Thanksgiving Day, November 29th.

Outside of the nearly complete destruction of peach buds by the low March temperatures, and some small damage to corn by local drought and hot winds, it was a fair to good year for all crops.

TEMPERATURE.

The annual mean for the State was 55.3°, or about 0.5° above the normal. January, August, and December were much warmer than normal. March, May, and October were colder than normal. The other months varied but little from normal conditions. The highest temperature, 108°, occurred at Hollister, Taney County, on August 14th, and the lowest, 11 below zero, occurred at Grant City, Worth County, March 19. In July only a few stations recorded temperatures of 100° or higher; in August about 32, but in both months the hot spells lasted only a few days. The winter cold spells were also short.

PRECIPITATION.

The annual precipitation for the State (rainfall and melted snow) was 41.23 inches, or about 2.36 inches more than the normal. January, March, June, September, October and December were somewhat wetter than usual. February, April, May, July, and November received somewhat less moisture than usual, although there was no persistent general deficiency in any month. The greatest local annual amount was 63.43 inches, at Caruthersville, Pemiscot County, and the least was 23.98 inches, at Edgerton, Platte County. The greatest local monthly amount was 11.83 inches, at Downing, Scotland County, in September. The least local monthly amount was 0.10 inch, at Fayette, Howard County, in January, and at Oregon, Holt County, in February. The greatest fall in any 24 consecutive hours was 7.42 inches, at Waverly, Lafayette County, on July 4th.

The seasonal snowfall was about 11 inches north of the Missouri River, about 10 inches in the southwestern plain, 4 inches in the Ozark Plateau, and less than 1 inch in the southeastern lowlands.

THE WEATHER BY MONTHS.

JANUARY.—Decidedly a mild month in all of Missouri, and the mildest January of record. Precipitation was unevenly distributed, the Ozark Plateau and southeastern lowlands being unusually wet, while the remainder of the State was relatively dry. There was very little snow. Outside of the wet sections the month was favorable for outdoor occupations. Winter wheat kept a good color and made good root growth.

FEBRUARY.—Averaged slightly colder than normal, but much of the month was open and mild. There was some near zero weather the first week, and spring-like the last week of the month. Precipitation was less than usual, though sufficient for needs. It is the eighth consecutive February with less than normal precipitation. There was one general snowstorm, on the 12th; it remained on the ground for about two days. There was much plowing, house building, and road construction done. Winter wheat did well.

MARCH.—Mainly a cold, wet, stormy month. Blizzard-like weather prevailed about the middle of the month, and particularly in the northern counties, where snow drifted three feet deep. Traffic was interrupted for a short time. The 19th was a real winter day, zero temperatures occurring at 32 stations. Peach buds were killed, but winter wheat was not damaged. Clover, alfalfa, and early sown oats were damaged.

APRIL.—The month's weather did not differ much from the usual. The cold of March overlapped the first few days of April, but by the 8th, following a snowstorm on the 5th, there was a reaction to more seasonable weather. Showers were frequent, but as a rule light to moderate, soil moisture being sufficient for needs. There were no damaging storms. Farming interests continued in satisfactory condition.

MAY.—Except the first and last weeks, the month was mainly cool, with general frosts about the 8th to 10th. There was a flurry of snow on the 8th. Precipitation was unevenly distributed, and there were a few local down-pours, and local damage. While conditions varied in parts of the State, the month's weather was unfavorable for farm work and crops, all vegetation being backward.

JUNE.—Temperatures did not differ much from the usual, but there was rather more cloudiness, rain, and wind than occurs in an average June. Hot, sultry weather prevailed from about the 16th to 26th, but the last four days were pleasant. Rainfall exceeded the normal. The latter half of the month was favorable for farming interests, and all crops fared well, wheat harvests being well advanced at the close of the month. Local storms 8th, 27th, and 28th.

JULY.—The month was somewhat warmer and drier than normal, especially over the eastern-third of the State. In the main, however, it was a pleasant summer month, and generally favorable from the agricultural side. There was some storm damage in the southwestern section on the 29th. At the close of the month farm work was well up to the average, and the main crops were normal or better.

AUGUST.—The outstanding feature of the month was a well marked cool wave on the 22d and 23d. Drought was rather a persistent feature in most of the Ozark Plateau and southwestern plain, while in most of the northern half of the State the month was wetter than usual. Heat was more noticeable in southern sections, the result of relatively scanty rainfall and much sunshine. Drought and hot winds damaged crops in the southwestern section, but elsewhere all crops continued in a normal state.

SUMMARY—*Continued from Page 49.*

SEPTEMBER.—A month of about normal temperature, and somewhat wetter than usual, particularly over the western part of the State. The outstanding feature was a general cool spell about the middle of the month that resulted in light frost on the 14th, and 16th, but without serious injury to vegetation. The general weather was favorable to farming interests.

OCTOBER.—As compared with the usual October this month was not so pleasant, being rather cloudy, wet, and chilly. Notwithstanding the rather frequent rainy spells, the seasonal farm work made good progress. Pastures continued green and plentiful. The first killing frost occurred on the 19th, to 21st, somewhat later than the average.

NOVEMBER.—Comparatively calm and settled weather, the normal type for this month, prevailed. A general snowstorm on the 29th was the outstanding feature. Pleasant and favorable weather for outdoor occupations. Winter wheat did well; and pastures were fine.

DECEMBER.—Unusually mild and open until the last two days. The fourth consecutive mild December, the warmest of the four, and the warmest of all other Decembers since 1889. Except the last two days, there were no characteristic winter spells, no sudden drop in temperature, no high winds, and almost no sleet or snow. There was, however, a marked change to winter on the 30th, and 31st generally. Winter wheat made good root growth, and kept a good color. Livestock kept in the open most of the time.

VOL. XXVIII. COLUMBIA, MO., JANUARY, 1924. No. 1.

GENERAL SUMMARY.

In marked contrast to the prevailing mild weather of December, 1923, January, 1924, was decidedly a winter month. The month opened with a severe cold wave that spread to the southern border of the State. After the 6th, there were a few days of relatively moderate weather, but cold weather again set in on the 11th and continued steadily for ten days or more. One of the outstanding features was frequent and heavy snows. It was the coldest and most wintry-like month since January, 1918. Only seven Junuarys in the past 36 years have been colder.

From 8. p. m. December 30, 1923, to 2 p. m. January 6, 162 consecutive hours, the temperature was below freezing, as based upon the thermograph record at Columbia, Mo., the section center. From 9 p. m. January 4 to 6 a. m. January 6, 34 consecutive hours, temperature did not rise above zero; and from 10:30 a. m. January 10 to 1 p. m. January 14, 99 consecutive hours, temperature did not rise above the freezing point. As compared with other Januarys, there were two with colder spells. In January, 1912, and again in the same month of 1918, zero temperatures prevailed for 52 consecutive hours.

The month was unfavorable for any outdoor work. Fuel, heavy clothing, and transit feeds were favorably affected. Winter wheat was mainly covered by snow. Peach buds apparently were injured in some localities. Highways were mainly firm and hard but slippery.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 24.9°, or 5.5° lower than the 36-year normal. It was the coldest January since 1918, though the present month was not as cold as that January by about 9°. About the same degree of cold prevailed in all sections. The first six days averaged about 16 degrees colder than normal, and about the same as during January, 1918. The period from about the 7th to the 10th of the present month was relatively moderate, but from the 11th to the 21st, inclusive, mostly cold, the daily deficiency being about 11°. The last ten days were moderate, the latter five days of this period being relatively mild, with daily means about 10° above normal. The average number of days with zero or lower was 6, though at some stations in the northern section there were 10 to 15 days with zero cold. The minimum was 25 below zero, which has been equaled once and exceeded three times in January since 1888. There were but three days with minima above freezing. On the 31st, afternoon temperatures were above 60° generally.

PRECIPITATION.

The average for the State, as determined from the records of 104 stations, was 1.54 inches, or about 0.49 inch less than the 56 years' average. By sections, the southwestern plain was a bit wetter than normal, while in the other four sections there was a deficiency, ranging from 0.40 inch in the northwestern plateau to 1.38 inches in the southeastern lowlands. There were only two or three days during each of the three decades on which no precipitation fell; the most frequent and general spell lasted from about the 9th to the 19th. Until the last few days of the month, most of the precipitation was in the form of snow, or sleet.

Snows were frequent and heavy, and covered the ground for about 16 days in northern and western sections. There was appreciable snow everywhere, save in the extreme southeast. From the 11th to the 16th snow fell daily, the heaviest falls occurring on the 15th, as a rule. The total at Brunswick, Chariton County, for the month, was 21 inches, 14 inches falling within a 24-hour period, on the 15th-16th.

WIND.

The prevailing winds were from the southern points, that is, about 45 per cent of the time from the southeast, and south; from the west, and northwest they prevailed about 35 per cent of the time. The total monthly movement, 8 stations equipped with anemometers reporting, was 7,598 miles, an average hourly velocity of 10.2 miles. Brisk to strong winds prevailed on the 4th, 8th, 10th, and 16th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 168, or 56 per cent of the possible, and about 5 per cent above normal. The sunshine this month was about 7 per cent more than last January.

MISCELLANEOUS PHENOMENA.

Earthquake (tremors).---At Greenville, 9 p. m. on the 31st.
Fogs, dense.---On the 10th, 29th, and 30th.
Halos, solar.---3d, 15th, 17th, and 23d.
Halos, lunar.---14th, 16th, 21st, and 23d.
Sleet.---1st, 2d, 3d, 10th, 15th, 16th, 17th, 18th, 19th, and 24th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for January, 1924.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., FEBRUARY, 1924. No. 2.

GENERAL SUMMARY.

The outstanding weather feature of February, 1924, in Missouri, was frequent and heavy snow. And, owing to this feature alone, the month has been listed in the public mind as severely cold and wintry. According to statistics of the several climatic elements published herein, the month's weather was made up of several alternating relatively cold and relatively mild spells, along with quite well defined precipitation and clear sky periods. For the month as a whole, temperatures were higher than normal in all sections. It also was remarkably free from sudden and severe temperature changes, and the sunshine, notwithstanding the frequent snows, was a bit more than usual. There were two typical winter temperature periods, from the 4th to the 8th, and 18th to 22d. From 1 p. m. of the 4th to 4 p. m. of the 8th, or about 100 consecutive hours, the temperature at Columbia, the section center, did not rise above 32°F.

The weather was unfavorable from nearly all standpoints. Farm work hardly made a start. House building, and road making were at a minimum movement. Snow drifts impeded railway traffic at times, and, owing to unusually bad public roads, country business was conducted mostly by horseback or horse-drawn vehicles.

Winter wheat made little progress, but was not injured. It was snow covered during the cold periods. Peach buds have been killed to a considerable extent; and some fruit trees in the northwest part of the State were damaged by an ice storm (frozen rain) the night of the 3d-4th. On the same date thunderstorms, attended by hail (a summer phenomenon) occurred at a number of places in the Ozark region.

TEMPERATURE.

The monthly mean temperature for the State as a whole was 33.8°, based upon the reports of 67 stations. This value is about 2° higher than the 36-year average. There was no prolonged cold or relatively warm periods. The first four days, and from the 9th to the 17th, and the 28th, and 29th, were warmer than normal. The coldest weather occurred during four days from the 5th to the 8th, inclusive; the longest cold spell prevailed from about the 18th to the 27th, but temperatures did not reach so low a value as during the first and shorter cold spell. Zero conditions occurred at about seven stations on the morning of the 6th. During the afternoons of 2d, 3d, 14th, and 28th temperatures reached 70° or higher at several quite widely separated points. There were 24 nights with temperature of 32° or lower.

PRECIPITATION.

The monthly precipitation, based upon records of 104 stations, was 1.84 inches, a deficiency from the 56 year's average of 0.31 inch. The precipitation was largely in the form of snow, the moisture being well distributed. There were three distinct precipitation periods, 4th to 6th, 16th to 20th, and 23d, and 24th. There was some moisture during the second week, but it was somewhat scattered save in the Ozarks where it was more general.

The snowfall was most frequent and the heaviest during any February since 1914. General and heavy snows prevailed on the 4-5th, 19th, and 23-24th. The first was attended by quite high winds that drifted the snow to considerable depths, resulting in some temporary stalling in cross-state traffic. The average fall for the State was more than 8 inches. In the Ozarks the snow was relatively light, differing somewhat from the usual. In nearly all of the State north of the Ozarks depths were remarkably uniform, ranging from 10 to 15 inches.

WIND.

The prevailing winds were from the northwest. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 7,372 miles, 10.6 miles an hour. Brisk to strong winds occurred generally on the 4th. Except drifting snow and stalling traffic no damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well placed stations equipped with sunshine recorders, was 178. This is about 57 per cent of the possible and about 4 per cent more than normal. There was about 1 per cent more sunshine than during the same month last year.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---In the Missouri River bottom lands and in the southeast part of the State on the 2d, and 27th.

Hail.---Arcadia, Caruthersville, Jackson, Poplar Bluff, Seligman, and Springfield, night of 3d, 4th.

Halos, solar.---3d, 13th, 15th, 25th, and 29th.

Halos, lunar.---10th, 12th, and 15th.

Sleet.---4th, 11th, 13th, 16th, 17th, 18th 19th, 22d, 23d, and 24th. Some fruit and other trees were damaged by ice (rain freezing as it touched objects) in extreme northwest on the 4th.

Thunderstorms.---Well developed, attended by hail, in Ozark Plateau, night of 3d, 4th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for February, 1924.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., MARCH, 1924. No. 3.

GENERAL SUMMARY.

Over all of Missouri March, 1924, was mainly cold, cloudy, and wet, although the precipitation while frequent, was not excessive. The outstanding features probable were the heavy snows rather persistent cold the first three weeks, and strong gales, thunderstorms and hail on the 28th, and 29th.

The chief adverse features were the hindrance to outdoor work in general and farm activities in particular, along with almost impassable roads. The usual business between town and country was carried on mainly by horse drawn vehicles.

The usual spring seeding was much behind, except in parts of the southwestern and southeastern sections where some progress was made during the last week. Winter wheat came through in fair to good condition. The main fruits were generally dormant. except in the extreme southeast.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting, was 38.4°, or 5.4° below the 36-year normal. It was the coldest March since 1915, and there have been but six that were colder in the past 37 years. There were few sudden temperature changes, the cold being persistent and steady in all sections. The first four days, and from about the 23d to the 29th, were the only days generally above freezing at night. From about the 5th to the 22d freezing occurred every night. The 27th was the only real warm spring-like day.

PRECIPITATION.

The average precipitation for the State, 101 stations reporting, was 2.55 inches, or about 0.45 inch leas than the 56 years' average. The precipitation was evenly distributed, although there was somewhat less in the southeastern lowlands than in the other sections. While it was frequent it was on most of the days light to moderate; in a general way the heaviest and most general precipitation fell on the 4th, 9-10th, 17th, 20th, 28th and 29th.

The snowfall was unusually heavy, the average for the State being over 9 inches. Snow was more or less general on the 9th, 13th, 17th, 19th, and 20th. The total monthly depths ranged from 8 to 20 inches in the Ozarks, and from about 6 to more than 10 inches north of the Ozarks. In Pike County 25.6 inches fell, 10 inches falling on the 20th.

WIND.

The prevailing winds were from the northwest. The average monthly movement, 8 stations equipped with anemometers reporting, was 6,679 miles, or nearly normal. Winds of from 40 to 60 miles an hour prevailed on 28th, and 29th. In some localities there occurred some of the associated features of the tornado, with damage to property and loss of life. See Special Storm Notes.

SUNSHINE AND CLOUDINESS.

There were only 8 clear days. The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 149. This is about 40 per cent of the possible, about 15 per cent less than normal, and 21 per cent less than March, 1923.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---On the 23d, and 28th.
Hail.---3d, 4th, 28th, and 29th.
Halos, solar.---8th, 9th, 12th, 16th, 20th, and 22d.
Halos, lunar.---12th, 14th, and 16th.
Sleet.---6th, 9th, and 16th.
Thunderstorms.---3d, 4th, 25th, 28th, and 29th.

SPECIAL STORM NOTES.

Thunderstorms attended by strong squalls and hail, occurred at Macon, Brunswick, Mexico, St. Catharine, Kansas City, Warsaw, and Poplar Bluff on the 3d, and 4th. There was no mention of any damage.

On the 28th, and 29th strong winds increasing at times to full gale force prevailed in all sections of the State. At many places there were severe thunderstorms with hail, and a few storms of the tornado type. Hail fell at St. Louis, Poplar Bluff, Vanduser, Lebanon, Neosho, Warrensburg, and Edgerton on one or the other of these dates.

Tornadoes: Oregon, Holt County, the evening of the 28th. Path about one-fourth mile wide by four miles long. Orchard trees were uprooted, telephone lines demolished, some stock killed, several barns and outbuildings torn down. Damage estimated at about $4,000.

Johnson County suffered from severe winds and hail on the 29th. A possibility of tornado winds, though details and damage estimates are not available as we go to press.

A severe wind, thought to have been a true tornado although no proof as it was night, traversed New Madrid, Scott, Bollinger, and Cape Girardeau counties between 10 and 11:30 p. m. of the 28th. Three persons were killed in New Madrid County and one injured, in Cape Girardeau County. Damage and destruction to property put at about $200,000. Over the entire southeastern portion of the State, as far west as Howell County and as far north as St. Louis, winds reached velocities of 60 miles an hour, and even higher. There were also strong and somewhat damaging winds in Barry, McDonald, Lawrence, Jaspar, Newton, and Dade counties.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for March, 1924.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., APRIL, 1924. No. 4.

GENERAL SUMMARY.

April, 1924, in Missouri, averaged warmer and drier than normal, but there were no outstanding features about either element that would cause more than passing remark. There were no damaging floods or winds, and while there was some frost as late as the 22d, there was no damage, chiefly because of the backward condition of all vegetation.

The month was somewhat more favorable than usual for outdoor work. Vegetation, however, responded slowly, and it was about the 20th before there was much foliage. Highways were unusually good. While much ground was prepared very little corn was planted. Wheat did fairly well; pastures and meadows were backward, particularly in the northern third of the State where good warm rains were needed.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 56.6°, or 1.5° higher than the 36-year normal. The temperature distribation was uniform, all sections of the State showing nearly the same plus departures. During the first ten days temperatures were unstable but the period was mainly cool. The first day was like winter, while the eighth was typical spring. The remainder of the month was made up of relatively warm and cool periods, the former lasting if anything longer than the cool spells. The 14-15th, and 16th were summer days. Night temperatures reached 32° or lower on three days.

PRECIPITATION.

The average precipitation for the State, 102 stations reporting, was 2.07 inches, or about 1.66 inches less than the 56 year's average. The month's moisture was deficient in all sections and at the same time was unevenly distributed. While precipitation fell on 10 to 15 days, appreciable amounts fell on 3 to 9 days only, the average being 6. Only from about one-third to one-half of the usual rain fell in the northern sections, and not much more than 50 per cent of the normal fell in the other sections. The heaviest monthly amount was 6.32 inches, at Dean, McDonald County, and the least was 0.48 inch, at Kidder, Caldwell County. The greatest in any consecutive 24 hours was 2.35 inches, at Dean on the 29th.

Snow fell at about 12 stations on the first. It melted soon after falling.

WIND.

The prevailing winds were from the southwest. The total movement, 8 stations equipped with anemometers reporting, was 7,515 miles, 10.4 miles an hour and about 10 per cent above the average. There were some fresh to strong winds on the 19th, 21st, and 29th.

SUNSHINE AND CLOUDINESS.

There were 14 clear days. The average number of hours of sunshine 6 well placed stations equipped with sunshine recorders reporting, was 270. This is about 68 per cent of the possible and about 9 per cent above normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---At Springfield on the 6th.

Frost, light.---17th, 18th, 22d, and 28th.

Hail.---At following places, without damage: Appleton City, and St. Louis on the 8th; Gano, on the 9th; Warrensburg, on the 16th; Jackson, and Poplar Bluff, on the 21st; Neosho, on the 29th, and Warrenton, on the 30th.

Halos, solar.---3d, 8th, 9th, 10th, 11th, 20th, 21st, 23d, 24th, and 25th.

Halos, lunar.---10th, 11th, 15th, 18th, and 19th.

Thunderstorms.---3d, 8th, 9th, 13th, 14th, 16th, 20th, 21st, 24th, 25th, 29th, and 30th.

Earthquakes.---Earth tremor felt at Jackson, and New Madrid at about 5.20 a. m.

SPECIAL STORM NOTES.

St. Louis, April 8th.---Thunderstorm began about 5:30 p. m. and ended shortly before midnight. There was hail, especially from about 9:15 p. m. to 9:30 p. m. The stones ranged in size up to about three-fourth inch, were irregular in shape, with snow centers. The estimated fall was 0.5 inch. Definite width of storm path could not be determined, but the press reported that in various parts of the city, some windows were broken by hail, telephone and electric lighting systems were put out of order by lightning, and that rain flooded some cellars. The total rainfall was 1.07 inches; 0.35 inch fell in 5 minutes, and 0.47 inch in 10 minutes.

Appleton City, April 8.---Thunderstorm attended by hail, passed over the city from northwest to northeast a little after 8 p. m. The stones ranged in size up to about one-half inch. No damage reported. A strong wind blew here on the 9th. Large limbs were broken off some trees but there was no other damage.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for April, 1924.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXVIII. Columbia, Mo., May, 1924. No. 5.

GENERAL SUMMARY.

May, 1924, in Missouri, was about the coolest month of its name of record. It also was the only May of marked deficient warmth that had no damaging freezes or killing frosts. The first week, excepting the first day, was mild and rather dry. On and after the 7th, though, the month was mainly cold. The coldest spells, fortunately, were attended by cloudy wet weather, which prevented any real frost damage.

There was some lack of moisture in western and northern sections during the first ten days, but the remainder of the month was rather wet, especially the last ten days. On the whole the moisture was opportune and beneficial in the drier sections, following the somewhat deficient rainfall of April.

The weather was unfavorable for certain lines of business, particularly in its relation to the automobile and gasoline traffic, being too cold for evening and night driving. The generally bad condition of the highways also was a setback. For farm interests, the season was unfavorable and backward.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 58.6°, or 6.0° lower than the 36-year normal. The lowest mean temperature and probably about the coolest May of record although the mean elements differed but little from those of the same month in 1917. The cool weather was persistent and uniformly distributed, but there were no damaging freezes or killing frosts. The 4th, 5th, 6th, and 20th were about the only really warm seasonable days. On the 1st, 11th, 24th, and 25th, morning temperatures approximated the freezing value, but there was no damage, skies being overcast and showery.

PRECIPITATION.

The average precipitation for the State, 104 stations reporting, was 4.67 inches, which agrees closely with the 56 years' average. The monthly precipitation was unevenly distributed, being somewhat excessive in the southern half of the State, and deficient in about the same amounts in northern sections. During the first two weeks or more showers were light though frequent, and during the last 10 days they were frequent, general and heavy. The heaviest monthly amount was 7.61 inches, at Lamar, and the least was 1.55 inches, at Tarkio. The greatest fall in any 24 consecutive hours was 3.90 inches, at Lamar on the 29th. A trace of snow occurred at four stations, on the 9th.

WIND.

The prevailing winds were from the northwest. The average wind movement was 7,079 miles, based upon records of 8 stations equipped with anemometers. The hourly velocity was 9.5 miles, or slightly more than usual. Strong winds occurred on the 23d, and 28th.

SUNSHINE AND CLOUDINESS.

The number of clear days was 10, one less than last May. The average number of hours of sunshine was 264, or about 59 per cent of the possible and about 4 per cent less than normal.

MISCELLANEOUS PHENOMENA.

Frost, light.---1st, 8th, 11th 22d, 24th, and 25th.
Hail.---2d, 6th, 9th, 13th, 15th, 17th, 19th, and 23d.
Halos, solar.---6th, 7th, 17th, 26th, 28th, and 30th.
Thunderstorms.---2d, 3d, 6th, 7th, 15th, 17th, 19th, 23d, 26th, 27th, 28th, and 29th.

SPECIAL STORM NOTES.

Boone County: During thunderstorm of May 5, Claud Hourigan, 10 year old school boy of Columbia, and Joseph Rice, farmer near Centralia, were killed by lightning.

Webster County; Thunderstorms with excessive rain and some hail caused considerable damage to crops at Seymour on the 7th, 19th, and 24th, and other places on the 28th and 29th. The storm of the 19th killed two cows, uprooted large trees, and demolished houses and barns. The hail path was one-half mile wide and about five miles long, and was destructive to crops. Damage estimated several thousand dollars.

A tornado-like wind swept across the counties of Greene and Webster the evening of May 19th, from northwest to southeast. The towns of Fair Grove, Strafford, and Seymour were within the path of the wind. No person was injured or killed.

May 23 was a day of severe thunderstorms. From Farmington, St. Francois County south to Pemiscot there was damage by wind, lightning, and hail. Within the territory embraced by Sikeston, Essex, and Caruthersville, seven persons were injured, and one, a baby, killed, by overturned houses or flying limbs of trees. The damage is put at about $20,000. During the same evening a thunderstorm passed over St. Louis, and St. Charles County.. According to press reports, 1,800 phones were burnt out in St. Louis.

AUG 4 1924
UNIV. OF ILLINOIS

Charity, Dallas County: About 8:30 p. m. a severe thunderstorm, wind, rain, and hail occurred at this place. On the following morning hail was found 18 inches deep in places. There was nearly a total loss of crops in path of the hail. Houses and barns were also damaged.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for May, 1924.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., JUNE, 1924. No. 6.

GENERAL SUMMARY.

June, 1924, was characterized by rather persistent cool weather, excessive cloudiness with general, frequent and copious rains. There also was a large number of severe thunderstorms, with attending downpours of rain, high wind, and hail, though the last element, fortunately, was confined to small sections. Generally trees, crops, and the telephone and telegraph wire systems embraced the property damage.

As a rule the weather was unfavorable for farming interests. Because of the lack of warmth, sunshine, and proper cultivation corn plants were small and off color, many fields being full of grass. Wheat harvest was later than usual and was further delayed by soft to muddy fields, preventing the operation of binders. All grasses did well. The prevailing conditions were similar to those of June, 1915.

The main rivers were running bankful, and many of the smaller rivers went out of banks flooding crops on the lower lands.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 64 stations reporting, was 72.5°, or about 1° lower than the 36-year normal. The Ozark Plateau and southeastern lowlands were a bit warmer than normal, and the other divisions, especially the northwestern plateau and northeastern lowlands were from 1° to over 2° cooler than the average. Neither cool nor warm periods persisted for more than two or three days at a time, and the alternations above or below the normal were not marked at any time. As a rule, the coolest weather occurred the first two or three days, while the warmest days were probably from the 18th to the 24th. Days with 90° averaged about 5.

PRECIPITATION.

The precipitation for the State as a whole, 100 stations reporting, was 7.39 inches, or about 2.72 inches more than the 56 years' average. It was the wettest June since 1896, although several Junes since that year averaged more than 6 inches. All sections were wetter than usual but the most marked excess occurred in the northwestern plateau. Rain fell somewhere in the State every day, except probably the 29th, and 30th. Heavy local downpours were the rule rather than the exception, from 3 to over 4 inches occurring in 24 hours or less at a number of stations. Thirteen stations received monthly totals exceeding 10 inches, while many exceeded 9 inches. The main rivers were running bankful, while many of the smaller streams went out of banks.

WIND.

The prevailing winds were from the south. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 6,221 miles, 8.8 miles an hour and about 9 per cent more than normal. Brisk to strong local winds occurred once or twice during each decade, the highest velocity reported being 57 miles from the northwest on the 12th, at St. Joseph, 67 at St. Louis on the 17th, and 55 at Kansas City, on the 26th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 280, or about 63 per cent of the possible, and about 7 per cent less than normal. June, 1922, had 77, and June, 1923, 68 per cent.

MISCELLANEOUS PHENOMENA.

Earthquakes or tremors.---Greenville and Puxico at 3 a. m. of 2d, and Arcadia and Farmington, at about 9:15 p. m. to 9:30 p. m., on the 27th.

Hail.---2d, 4th, 5th, 6th, 9th 12th, 17th, 18th, 24th, 25th, 26th, and 27th.

Halos, solar.---5th, 6th, 9th, 10th, 12th, 13th, 18th, 21st, and 25th.

Halos, lunar.---None.

Thunderstorms.---Local, 2d, 3d, 4th, 5th, 6th, 10th, 11th, 13th, 14th, 22d, 23d, and 29th. General and severe.---8th, 9th, 12th, 15th, 16th, 17th, 18th, 20th, 24th, 25th, 26th, 27th, and 28th.

SPECIAL STORM NOTES.

This June was noticeable for an unusual number of severe local storms, but, owing to limited space, we can mention only the most extensive and severe:

June 5.—Hail damage occurred over large portions of Shelby, Marion, Ralls, and Pike Counties, from about 11:30 a. m. to 1:00 p. m. The path was from northwest to southeast, and traversed a track averaging about 4 miles in width. Estimated loss to crops, $100,000; and other property, including window glass, roofs, chickens, sheep, etc., $3,000.

June 12.—From about 5 a. m. to 5:40 a. m. a severe thunderstorm with attending high wind demolished outbuildings, stripped shingles from roofs, uprooted thousands of orchard and shade trees, and wrecked several silos and barns in Holt and Buchanan counties. The storm crossed into Missouri near Corning, and passed southeast with a front nearly forty miles wide. DeKalb in Buchanan County had over $10,000 hail damage, chiefly to orchards; St. Joseph district reported hundreds of claims ranging from $5 to $100 with an estimated total of $25,000; western Andrew County was damaged about $12,000; Oregon County over $40,000, chiefly to trees, orchards, and crops. The total loss to property is put at $40,000, and to crops about $90,000. Perhaps 700 square miles were involved.

June.—A local storm in the vicinity of Glasgow caused severe damage to roofs and trees. Because of the narrow path and severe conditions reported, this storm probably was of the tornado type. Excessive rains occurred over a wide area on this date.

June 24.—Tornado crossed the Missouri River from Kansas in the vicinity of St. Joseph, at 5:25 p. m., and traveled eastward to Clarksdale, about 25 miles. Damage occurred where the storm passed over the river near St. Joseph, but chiefly in the vicinity of the One Hundred and Two River. Here, in a path two miles long and about one hundred or more yards wide, destruction was nearly complete. Three persons were seriously injured, and property loss amounted to about $65,000. Excessive rainfall followed the passage of the storm.

June 26.—Damaging hail fell in Kansas City at 11:45 p. m. Loss about $10,000, mostly to greenhouses.

Quite severe local storms, resulting in considerable damage to telegraph and telephone wire systems, and trees, occurred at Appleton City the night of the 8th; at Joplin and vicinity, at 5:30 p. m. of 9th; at Mountain Grove, 15th; Columbia, Jefferson City, Mexico, Downing, and Seligman, on the 24th or 25th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for June, 1924.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., JULY, 1924. No. 7.

GENERAL SUMMARY.

Persistently and uniformly low temperatures for the season, much cloudiness and rain, and a few rather severe local storms were the more outstanding features of July, 1924. As compared with other years only a few Julys have been as cool as the current month, namely, in 1915, 1905, and 1891.

The rainfall was above the normal, but the month was not as wet as several other Julys in the past, though it was more uniformly distributed this July. While some rain fell in some parts of the State nearly every day the heaviest and most continuous fell mainly during the second decade. There were some large amounts in all sections, but especially in the western parts of the Ozarks, southeastern lowlands, and southwestern plain.

Harvesting and threshing wheat, hay making, and other farming operations were hindered by showers. Corn did well but was about two weeks backward. not because of the July rains, but because of the wet June and May.

TEMPERATURE.

The mean temperature for the State, as determined from the records of 65 stations, was 73.3°, or about 4.1° lower than the 36-year normal. It was the coolest July since 1905, and only one other July (1891) since the beginning of State records in 1889 was as cool as the current month. The deficiency was noticeable in all sections but somewhat less so in the Ozarks and southeastern lowlands. Except about five or six days in the last half of the month, the temperature was continuously below the normal. Early morning temperatures on the 1st, 3d, 4th, and 5th varied between 40° and 45°. The minimum, 40°, has been recorded only once before this in July, in 1891. Afternoon warmth on the 16th, 23d, and 24th, approximated full summer value in most parts; a maximum of 103° occurred at Caruthersville, on the 24th.

PRECIPITATION.

The precipitation for the State as a whole, 104 stations reporting, was 5.39 inches, or 1.34 inches more than the 56 years' average. There was excess moisture everywhere, but the wetness was much more marked in the Ozark Plateau and southwestern plain than in other parts. Rain in more or less appreciable amounts fell in some parts of the State on almost every day, though there was less rainy weather in the northwestern plateau. The heaviest and most continuous rainy spell probably continued from about the 9th to the 22d. The greatest local monthly fall was 14.52 inches, at New Madrid; and the greatest 24-hour amount, 7.14 inches, fell at the same station, on the 19th. The next heaviest falls within a period of 24 consecutive hours, were 5.16 inches and 5.20 inches, at Lockwood and Lamar, respectively.

WIND.

The prevailing winds were from the south. The average movement based on records of 8 well placed stations equipped with anemometers was 5,098, 6.9 miles per hour or about 6 per cent less than normal. There were some local high winds on the 16th, and 17th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 stations equipped with sunshine recorders, was 318, 70 per cent of the possible and very nearly normal. The current month had about 6 per cent less sunshine than July, 1923.

MISCELLANEOUS PHENOMENA.

Hail.---At Arcadia, 5th; Louisiana, 6th; Appleton City, 13th; St. Joseph, 16th, and St. Louis, 17th. No damage reported.

Halos, solar.---4th, 11th, 17th, 18th, 19th, 20th, 27th, and 28th.

Halos, lunar.---10th, and 11th.

Thunderstorms.---Local, 1st, 2d, 3d, 11th, 13th, 14th 20th, 28th, and 29th. General 12th, 16th, 17th, 19th, 21st, 22d, 30th, and 31st.

SPECIAL STORM NOTES.

July 12.---Thunderstorm, attended by high wind and excessive rainfall, occurred at Lamar, Mo., beginning about 4 p. m. of the 11th and ending after midnight; 5.20 inches of water fell, and considerable damage was done to crops, probably several thousand dollars.

July 14.---At Appleton City a thunderstorm, attended by heavy rain, high wind, and some small hail, occurred the night of the 13-14th. There was some relatively small damage to fruit and shade trees, and electric wire systems.

July 16-17th.---A severe electric storm with strong squalls and heavy rainfall swept across the State from southwest to northeast, beginning in the southwest about Sedalia at or before 11 p. m. and crossing the Mississippi River at St. Louis at about 1:45 to 3 a. m. At Columbia the wind reached a velocity of 50 miles an hour just before midnight, while a 63 mile gale blew at St. Louis later. Damage to trees, and the telegraph and telephone systems in Columbia, about $5,000; at Fulton, including roofs, plate glass, etc, $10,000, and about the same amount at Jefferson City; at Wellsville homes, barns, and crops were damaged, estimated at about $15,000. At St. Louis 13 houses were set on fire by lightning. The Bell Telephone Company was damaged to the amount of $85,000. Some parks were seriously damaged. Total loss heavy but not given.

From midnight of the 18th to 3:30 a. m. of the 19th, 7.14 inches of rain fell at New Madrid. There was considerable damage but no estimate given.

July 24.---A severe windstorm swept over the town of Martinsburg, Mo., about 11:40 p. m. The storm's path was about two miles wide. Several barns were blown over; trees, telephone, and telegraph poles blown down; and two cows were killed. Damaged to the amount of several thousand dollars.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for July, 1924.

[a], [b], [c], etc., indicate respectively 1, 2, 3, etc., days missing from the record. §§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

UNMS

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., AUGUST, 1924. No. 8.

GENERAL SUMMARY.

As compared with averages, the weather of August, 1924, in Missouri, was without unusual features, though it does stand out as the only real summer month of the year. Normally July is warmer than August, but the current month was much warmer than the preceding July, though, it must be said, July was an uncommonly cool summer month. The temperature conditions of the current August, however, were not constant. Except a few scattered summer days, the first half or more of the month was mainly cooler than normal. The last ten days were persistently hot, and more than made up the deficiency of the first part. The extremes of 48° and 106° are well within limits of past years.

There was no lack of rainfall anywhere. Crops were good generally, and throughout the Ozarks they probably were never better at the time of season. Thunderstorms were numerous, but mostly of a mild type. Damage resulting from rain, hail, and wind was relatively small, and local.

TEMPERATURE.

The monthly mean temperature for the State was 77.2°, as based upon the reports of 65 stations. The month was nearly 4° warmer than July, and about 1.2° warmer than the 36-year August normal. In the northwestern plateau the average daily excess was less than 1°, but in the other four divisions it ranged from 1° to 1.5°. Except some warm weather a few days during the first half of the month was mainly cool, but real summer weather prevailed most of the time on and after the 19th. Afternoon temperatures reached 90° or higher on 17 days, and the 100° was reached at nine stations on one or two days. The extremes were 106° and 48°.

PRECIPITATION.

The precipitation for the State, 102 stations reporting, 4.14 inches, or 0.46 inch more than the 56 years' average. Over portions of the southwestern and northwest sections the rainfall was slightly less than normal; it was normally wet in the northeast, and excessively wet in most of the Ozark Plateau; in the southeastern lowlands the month was more than 1 inch dryer than usual. Except in the southeastern lowlands showers fell quite often, the most general and heaviest falling on the 5-6th, 10-11th, 14-16th, and 22-24th. The greatest local monthly amount was 9.51 inches, at Lebanon, and the least was 0.99 inch, at Warrensburg. The greatest amount in any 24 consecutive hours was 3.50 inches, at Lebanon on the 11th.

WIND.

The prevailing winds were from the south. The average movement based upon the reports of 8 stations equipped with anemometers, was 5,768 miles, or about 7.8 miles an hour, and about 15 per cent more than normal. There were a few thunderstorm squalls.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, six well placed stations equipped with sunshine recorders reporting, was 327, 74 per cent of the possible, and about 3 per cent more than normal. The current month had about 6 per cent more sunshine than August, 1923.

MISCELLANEOUS PHENOMENA.

Hail.---At Downing, Fayette, and St. Joseph, 8th. Conception, Kidder, 23d. Eldon, on the 24th.

Halos, solar.---1st, 4th, 8th, 22d, 24th, and 31st.

Halos, lunar.---None.

Thunderstorms.---General, 2d, 6th, 8th, 19th, 24th, and 31st. Local, 1st, 4th, 9th, 10th, 11th, 15th, 16th, 21st, 22d, and 23d.

SPECIAL STORM NOTES.

During the afternoon and evening of the 23d a thunderstorm, attended by rain, hail, and squalls, advanced from west to east across the northwest part of the State from about Buchanan to Nodaway counties and as far east as Caldwell and Daviess counties. Damage was light, except in the neighborhoods of Conception, and Kidder. At Conception some hail was "goose egg size", and at Kidder, the stones "were large." Damage seemed to have been confined to relatively narrow strips, mostly corn, but a few windows were broken and outhouses damaged. Estimated damage put at about $10,000.

Wind squalls, with some minor damage, occurred at Brunswick on the 5th; Gorin on the 8th, and Maryville on the 24th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano Salem, R. F. D. No. 5.

Daily Precipitation for Augsut, 1924.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., SEPTEMBER, 1924. NO. 9.

GENERAL SUMMARY.

The outstanding feature of September, 1924, in Missouri, was persistent cool weather. Using terms applied by the general public, September apparently had changed places with October. The records show that only three other Septembers in 37 years have been as cool or cooler than the current month. Normal warmth obtained on not more than five or six days any where during the entire month. The last ten days were markedly cool; and frost, ranging from light to killing, occurred in all sections on the morning of the thirtieth. The injury to vegetation depended upon the topography more than latitude. In fact, lower temperatures were recorded in the southern than in the northern part of the State. On the whole, damage was light, and confined to low lands.

The month's weather was unfavorable, as a rule, for maturing the corn crop. The rainy periods were too close together, in connection with the prevailing lack of warmth. The bulk of the crop, however, was safe from ordinary frost by the end of the month. Preparations for fall seeding progressed favorably, save in a few of the excessively wet counties.

There was no flood damage. Winds caused some little local damage.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 67 stations, was 64.0°, or about 5° below the normal for 36 years. It was the coolest September since 1918, and only two others, (1890, 1902) have been as cool or cooler since 1888. There were but few days during the month when the temperature was above normal. The extremes were 96° and 29°, on the 8th and 30th, respectively. Light frosts were recorded on the 28th, and 29th, and heavy frosts on the 30th; in some localities in low places killing frost, with thin ice occurred. The 1st, 7th, and 20th were the warmest days, the 11th also might be included. Afternoon temperatures on these dates were 90° or higher quite generally.

PRECIPITATION.

The average precipitation for the State, based upon the records of 104 stations, was 3.77 inches. The departure from the 56 years' average was plus 0.04, or practically normal. The precipitation was unevenly distributed, though there was ample for all present needs, and a bit too much in some localities. South of the Missouri River about 18 counties had an excess of moisture, while not more than 10 in the northern sections were much wetter than usual. The more or less general rains fell on the 1st, 7th, 11-12th, 15-16th, 19-20th, and 27th (1st and 19-20th probably the heaviest). The heaviest local monthly amount was 8.92 inches, at Fredericktown. The heaviest in any 24 consecutive hours was 3.72 inches, at Arcadia on the 20th.

WIND.

The prevailing winds were from the southeast. The total wind movement, based upon the records of 8 stations equipped with anemometers, was 6,062 miles, or an hourly velocity of 8.2 miles. This is about 5 per cent more than normal. There were a few local high winds, particularly on the 19th, and 21st.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 244. This is about 66 per cent of the possible, and very near the normal for September. The same month in 1923, had 8 per cent less sunshine than the present month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---3d, 20th, 23d, and 28th.

Frost, light.---28th, 29th, and 30th. Heavy, 30th. Killing, thin ice, in low places, 30th.

Hail.---Some small stones fell at Mexico on the 1st, Columbia and Liberty on the 8th, Kansas City 11th, and at Liberty on the 15th.

Halos, solar.---5th. 6th, 10th, 11th, 12th, 15th, 17th, and 26th.

Halos, lunar.---11th, and 17th.

Thunderstorms.---1st, 7th, 11th, 15th, 16th, 19th, 21st, 26th, and 27th.

SPECIAL STORM NOTES.

September 12.---Quite a violent wind occurred at Downing, Schuyler County, about 7:30 p. m., doing much damage to telephone wires, and trees.

September 18th.---During a thunderstorm about 5:30 p. m,, a barn owned by Franklin Lollar, 8 miles southeast of Cameron, Clinton County, was struck by lightning and burned. One horse was killed and six injured. Other stock was saved. About 25 tons of hay, 2700 bushels of wheat, farming machinery, etc., were destroyed. Loss above $8,000. Insurance about $2,000.

September 19th.---A strong wind crossed northeastward through Reynolds and Iron counties about 6 p. m. Apparently the storm had some of the characteristics of the tornado. The path was a few hundred yards wide. One reliable observer said there was a funnel-shaped cloud, but was not lower than tops of trees when seen. It dropped to the ground in spots. The greatest damage was done at Annapolis, Iron County, where "thirty to forty houses were partly wrecked or damaged." Strong winds were felt also at the towns of Leadanna, Hogan, and Ellington. Estimated damage put at $30,000, mostly at or near Annapolis.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for September, 1924.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

DEC 3 1924

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXVIII. Columbia, Mo., October, 1924. No. 10.

GENERAL SUMMARY.

"There is nothing so fine as October weather in Missouri" is a common saying. The current month was no exception to the general rule. Though the opening days of this October were a bit chilly and wet, yet by the 6th or 7th,, warm, sunshiny weather had set in and prevailed, with but slight exceptions, to the end of the month. It was the driest October since 1917, and the warmest, probably with the exception of 1920, since 1900.

The month, as a whole, was ideal for practically all outdoor pursuits. Seasonal farm work, house building, and highway making continued with hardly an interruption. The persistently warm weather, though, somewhat adversely affected heavy clothing, and fuel trades. On the other hand the trade in automobiles and accessories was very active.

Farm operations were put in good condition for winter quarters. Wheat was up and looking fine. Soil moisture was sufficient for needs, save in the southeastern lowlands where rain was needed. Corn had dried out well and cribbing was underway.

The killing frosts that occurred during the fourth week were not early enough to find any crops subject to injury.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 61.8°, or 4.4° higher than the 36-year average. It was the warmest October since 1900, although the one of 1920 was nearly as warm. Most of the first week was a bit cooler than usual, but from about the 7th to the 20th, and the last four or five days were markedly and persistently warm, the daily excess ranging from 6° to 13°. Afternoon temperatures approximated real summer heat on several days, the maximum being 92°. The only cool snap occurred during the period from the 23d to the 26th, when minimum temperatures ranged from about the freezing value down in the low twenties, the lowest recorded being 21°. This was the first killing frost period, but all crops had matured.

PRECIPITATION.

The average precipitation for the State, 104 stations reporting, was 1.22 inches. The departure from the 56 years' average was minus 1.53 inches. It was the driest October since 1917. Practically all of the month's precipitation fell on the the days from about the 3d to the 10th, and the last two days of the month, the average for the State being only four days. Hardly any rain at all fell in the southeastern lowlands, and not more than one-third of the usual amount fell in the Ozark region. The greatest monthly amount was 4.17 inches, at Stover, Morgan County, and none was recorded at Annapolis, Iron County, Greenville, Wayne County, and Birchtree, Shannon County. The plains, a strip of country running from the northeast to the southwest part, embracing the western end of the Ozarks, received from one to more than two inches of water, the remainder of the State less than one inch.

WIND.

The prevailing winds were from the south. The average monthly movement, 8 stations equipped with anemometers reporting, was 5,774 miles, an hourly velocity of 7.8 miles. A strong steady gale, 35 to 55 miles an hour, prevailed on the 30th, but no damage was reported.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 well placed stations equipped with sunshine recorders, was 273. This is about 79 per cent of the possible, and about 13 per cent above normal, and 20 per cent more than the same month in 1923. There were 22 clear and only 4 cloudy days.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—4th, 7th, 10th, 17th, and 20th.

Frost, heavy.—22d.

Frost, killing.—First general of the season (outside of St. Louis and Kansas City) on the 23d. Thin ice each night up to 26th.

Hail.—Small hail fell at Clifton Hill, Eldon, and Lockwood on the 3d, and at Louisiana on the 4th.

Thunderstorms.—3d, 4th. 5th, 6th, 7th, 9th, 28th, and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for October, 1924.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXVIII. Columbia, Mo., November, 1924. No. 11.

GENERAL SUMMARY.

The general weather of November, 1924, was mild and pleasant in all of Missouri. The outstanding features were moderate and uniform temperatures, many bright days, and just moisture enough at timely intervals for general needs. There was rather more wind than usual, but the bright side offset that element.

The month, as a whole, averaged warmer than normal, being at the same time the fourth consecutive November with above normal temperature, but was not quite so warm as the same month in 1922.

The chief rains came about the middle of the month, but there were no very heavy falls anywhere. These were timely and beneficial, especially in sections south of the Missouri River, and more particularly in the southeastern section. A light snow fell near the close of the month, bringing with it a reminder of winter.

The conditions were favorable for winter grains, live stock, and for all outdoor work. Work on the main highways was nearly continuous. Trade in fuel, and heavy clothing was a bit sluggish; but the automobile, gasoline sales, and general accessories to the business were much favored by the fine weather.

TEMPERATURE.

The monthly mean temperature for the State, as determined from the records of 64 stations, was 46.7°, or 2.2° higher than the 36-year average. It is the fourth consecutive November with mean temperature above the normal. Temperatures were uniformly distributed, the averages for the five physiographic divisions agreeing within small values. The first week was the warmest, the 3d, 5th, and 6th being almost summer-like. The coldest day—the one real cold day of the month—was the 29th; minimum values ranged from 18° down to 10° above zero generally, and between 10° and 6° above zero at about 16 stations. The average number of days with minimum of 32° or lower was 14.

PRECIPITATION.

The average precipitation for the State, 100 stations reporting, was 1.72 inches. The departure from the 56 years' average was minus 0.63 inch. While less than normal moisture fell in all sections, the distribution was satisfactory and sufficient for needs. The more general rains fell on the 7th, save in the southeast; 10th to 13th, except the northwest, and general in southern parts on the 14th. The heaviest monthly fall was 4.11 inches, at Caruthersville, and 1.68 inches, at Amoret on the 14th, was the heaviest in any 24 hour period.

The first general snow of the season fell on the 27th and 28th; amounts ranged from 1 to 3 inches in all counties bordering the Missouri River; other sections under one inch to inappreciable amounts.

WIND.

The prevailing winds were from the northwest. The monthly movement, 8 stations equipped with anemometers reporting, was 7,998 miles. The average hourly velocity was 11.1 miles, about 13 per cent more than normal. Strong winds, 34 to 52 miles per hour, occurred 5th, 6th, 11th, and 21st.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 200. This is about 68 per cent of the possible and about 11 per cent more than normal, and about 7 per cent more than November, 1923.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—1st, 9th, 13th, and 15th.
Hail.—At St. Joseph, Oregon, and Lebanon on the 6th; Columbia, St. Louis, Hannibal, Eldon, and Gano on the 11th; at Oregon on the 13th, and 26th. No damage.
Halos, solar.—3d. Lunar.—4th, 7th, 10th, and 12th.
Sleet.—Springfield 14th.
Thunderstorms.—6th, 7th, 10th, 11th, 12th, and 13th.

SPECIAL STORM NOTES.

Birchtree.—A strong local wind, having some of the features of the tornado, occurred on the 11th; damage considerable.

Seymour.—A tornado-like wind occurred on the 11th, with hail; most of the tornado was high in the air. Small damage. High winds occurred on several dates at Lockwood, Clifton Hill, Downing, St. Catharine, Farmington, Lamonte, and Oregon; no resulting damage.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for November, 1924.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., DECEMBER, 1924. No. 12.

GENERAL SUMMARY.

The outstanding features of December, 1924, in Missouri, were the severe sleet storm that prevailed from the night of the 16th to the 18th, and 19th, severe cold along with ice covered ground the remainder of the month, and the resulting heavy property loss, and suffering to man and beast.

The first half of the month was mainly moderate and open. There was an abrupt change to severe winter during the night of the 16th and and following 17th, that reached the southern limits of the State by the 19th. Rain, freezing as it fell, with a mixture of sleet and snow prevailed. Over the central part of the State the storm prevailed for 48 consecutive hours. For ten consecutive days beginning with the 17th, temperatures did not rise above 32° in any hour of the 24 over most of the State north of the Ozarks. Subzero cold, ranging from 8° below zero to 28° below zero, swept the State on the 28th. For ten days following the sleet all overhead objects carried a heavy load of ice. There was practically no melting, and the only evaporation that took place was through the process of sublimation. It was the coldest December period of record. And for the severity and duration of the ice-storm, the time the ice remained on the ground, and resulting widespread damage, there is no other storm of any winter comparable with it in the climatological history of Missouri.

The damage was greatest in the central and east-central sections of the State. The conditions were appalling. Roofs of some houses gave way under the ice load. It was estimated that a flat roof about 30x50 feet square carried a load of 12 tons of ice, and warnings were issued advising the public to take the proper precautions. Many trees were stripped of limbs or entirely broken down. Literally thousands of telephone and telegraph poles went down, with a tangled mass of wires. Practically all traffic and business lines were suspended for a time. It was ten days or more before the utility companies got back to normal, and some still struggled with abnormal conditions at the very close of the month.

Winter wheat was not, it is thought, seriously injured in the northwestern and southeastern portions of the State, as the sleet was less severe in those sections. Over most of the remainder of the State a solid ice sheet prevailed to the close of the month. While the condition of the wheat crop was problematical, the concensus of the best opinion was decidedly pessimistic. Because of the way the best orchards are kept trimmed and pruned, helped probably by the peculiar formation and fibre of the wood, fruit trees escaped serious breakage. Some live stock were frozen in the fields, also chickens, and wild birds, the last doubtless largely to lack of proper food.

At the close of the year, no one had been bold enough to estimate the total damage and loss resulting from this December storm and weather. The Southwestern Bell Telephone Co., issued a statement that the company had suffered a loss of $1,000,000 to the west of St. Louis alone.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting, was 27.7 degrees, or 6.2 degrees lower than the average for 36 years. It was the coldest December since 1917, and the fourth coldest of record. The cold was general in all sections, but was somewhat more marked in the western and northern divisions. The latter half of the month was perhaps the coldest December period of record. The mildest weather occurred during the the first half. On about 25 days the minimum was 32 degrees or lower, and zero cold obtained on 5 days. At a few stations subzero temperatures occurred on all but three or four days of the last 15 days. The absolute minimum was 28 degrees below zero, being 1 degree of the record for this month.

PRECIPITATION.

The average precipitation for the State, 104 stations reporting, was 3.43 inches, or about 1.40 inches more than the 56 years' average. It was the wettest December since 1895. The excess moisture was marked in all divisions, except the southeastern lowlands where it was about normal. A rain that froze as it fell mixed with sleet and snow prevailed from the night of the 16th to the 19th, and caused the most severe property losses of record. An ice layer varying from one to 6 inches thick covered most of the State the last 15 days of the month. Some day thawing with nightly freezing resulted in an almost solid sheet of ice, a prolonged condition unequaled in the past three decades or more.

All of the precipitation of the latter half of the month was frozen rain, sleet or snow. The last element in itself was not unusual, the average depth for the State being 4.6 inches.

WIND.

The prevailing winds were from the north. The average monthly movement, 8 stations equipped with anemometers reporting, was 7,676 miles, and average hourly velocity of about 10.3 miles. This is about the usual for December. Brisk winds obtained on the 5th, and 8th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 142. This is about 48 per cent of the possible and approximates the normal for December.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—3d, 4th, 6th, 7th, and 30th.

Halos, solar.—10th, 12th, 27th, 28th, and 29th.

Halos, lunar.—5th, 6th, 10th, and 12th.

Sleet or glaze.—5th, 14th, 16th, 17th, 18th, and 19th, and in southeast on 23d, and 24th.

Thunderstorms.—Kansas City and St. Joseph on the 4th, at St. Louis, Cairo, Springfield, and St. Joseph on the 7th; at Springfield, 17–18th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but in all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for December, 1924.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXVIII. COLUMBIA, MO., YEAR, 1924. No. 13.

GENERAL SUMMARY.

While the mean values of all the weather elements of the year 1924, in Missouri, did not differ very much from the usual, at the same time the year was in some respects the most remarkable of the past decade or more.

The most noticeable part of the year probably was the cool, wet summer. If we except a part of August it was a year almost without a summer in a comparative sense. The year started with an unusually cold and snowy month; the spring was mostly cold and wet. September was unusually cold and wet. The autumn, however, was about ideal; and soothed one's feeling and thoughts, and made one forget the past unfavorable days. Missouri autumns usually make one feel, as Thoreau felt and said at the close of an ideal American autumn day, "Here has been such a day as I think Italy never sees."

Favorable outdoor weather prevailed up to about the middle of December, at which time an abrupt change to winter set in. Rain, sleet, and snow began the night of the 16th and prevailed to the 19th. All overhead objects were covered with a heavy load of ice for ten days or more. More than three-fourths of the State was covered by a solid ice sheet to the end of the month. The last fifteen days of December averaged colder than than any other similar period of record. As to the severity of the ice-storm, resulting damage, and duration of ice covered objects there is no similar spell of weather comparable with it during the past thirty years or more.

Corn planting and cultivation was much hindered by frequent rains and wet soil during May and June; considerable was abandoned to weeds and overflowed bottom lands. Wet weather and soft ground interfered with proper ripening of wheat, and harvesting the grain, as well as hay making. Quite a severe frost at the end of September damaged some late planted corn. The fine autumn was favorable for finishing up and drying out crops before the first general freeze came. The low temperatures of January killed the peach buds; other fruits were good. In spite of much adverse weather the yields of most crops averaged near normal. Fortunately there were no unusually severe wind or hailstorms during the year. The December ice-storm caused heavy property loss, probably running into millions of dollars. The traffic and utility lines of business suffered the most. Man and beast suffered from the effects of the prolonged icy conditions, and there was some loss in range live stock.

THE WEATHER BY MONTHS.

JANUARY.—One or two moderate spells, but mainly cold, with frequent precipitation, mostly snow. There were but three days with minima above freezing, the absolute minimum being 25 below zero. Unfavorable for any outdoor work. Fuel, heavy clothing trade, and transit feeds were favorably affected. Wheat was mainly covered by snow. Peach buds were generally killed.

FEBRUARY.—The outstanding feature was frequent and heavy snow. In the main the month's weather was made up of several alternating relatively cold and relatively mild spells, along with quite well defined precipitation and clear sky periods. The month was remarkably free from severe and sudden temperature changes. The weather was unfavorable from all standpoints. Snow drifts impeded railway traffic. Country and town exchanges were carried on mostly by horseback or horse-drawn vehicles. Wheat was dormant, and locally damaged.

MARCH.—Mainly cold, cloudy, and wet. Heavy snows, persistent cold the first three weeks, and strong winds, thunderstorms with hail on the 28th and 29th were the more marked features. Outdoor work and farm activities in particular were nearly at a standstill. Highways were almost impassable. The usual spring seeding was much delayed. Winter wheat came through in fair condition. The main fruits were dormant, except in the extreme southeast.

APRIL.—The month opened with snow, and the first week was mainly cold. From on and after the 8th the month was made up of relatively warm and cool periods, the former lasting longer than the cool spells. Frost occurred on the 22d. There was little or no damage, chiefly because of the backward condition of all vegetation. The month averaged warmer and drier than normal, and the usual farm work made considerable progress. There was little planting, however, owing to rather cold soil. Wheat did fairly well. Pastures, meadows, as well as other vegetation were very backward.

MAY.—The first week, excepting the first day, was mild and rather dry. The remainder of the month was mostly cold and unseasonable. The coldest spells were attended by cloudy, wet weather which prevented any serious frost damage. The precipitation was unevenly distributed, being somewhat excessive in the southern half of the State, and deficient in the northern half. Generally unfavorable for farming interest, which was backward.

JUNE.—A month of persistent cool weather, excessive cloudiness, and frequent copious rains. A large number of severe thunderstorms, and some high winds, and damaging hail. Generally unfavorable for farming interests. Because of lack of warmth, sunshine, and proper cultivation, corn plants were small, off color, and grassy. Wheat harvest delayed by rain and soft ground. Main rivers bankful, and smaller streams out of banks.

JULY.—Uniformly low temperatures for the season, much cloudiness and rain, and a few rather severe local storms were the outstanding features. One of the coolest Julys on record. The usual farm work was much hindered by wet weather. Corn improved somewhat, but backward. All grasses made fine growth.

AUGUST.—The only real summer month of the season. From about the 9th to the 19th was mainly cooler than normal, but warm to excessively warm weather prevailed the first week and last ten days, which was needed and favorably affected all crops. Thunderstorms were numerous but mostly of a mild type. There was, as a rule, too much rain for general needs.

SEPTEMBER.—Unusually cool month, one of the coolest Septembers of record. Normal warmth obtained on not more than five or six days. Frosts ranging from light to killing, occurred generally on the 30th. Corn stood in need of warm, drying-out weather. While no excessively heavy rains occurred, the rainy spells were too frequent when considered with the lack of warmth. Preparation for fall seeding made good progress, save in some of the wettest counties.

OCTOBER.—After the first week, the weather was about ideal throughout the State for all outdoor pursuits, and drying out corn. About the driest October since 1917, and the warmest in about 20 years or more. Much wheat was up and looking fine, moisture being sufficient for needs, save in the southeastern lowlands. A general and killing frost occurred during the fourth week, but was not early enough to find any crops subject to injury.

SUMMARY—*Continued from Page 49.*

NOVEMBER.—A mild, bright, and exceptionally pleasant month. There were a few timely and beneficial rains. A light snowfall near the close of the month brought a reminder of winter. Winter grains, live stock, all outdoor work, and the general business trades were favored by the fine weather, except fuel, and heavy clothing channels were a bit sluggish. An unusual amount of plowing for spring planting was done.

DECEMBER.—The first half of the month was mainly moderate and open. An abrupt change to winter occurred the night of the 16th, and severe winter weather continued the remainder of the month. The last 15 days of the month averaged colder than any other similar period of record. A rain, sleet and snowstorm prevailed from the 16th to the 19th. Fully three-fourths of the State was covered by a solid ice sheet the last half of the month. For severity and duration, and resulting damage and loss there is no other storm period comparable with it in Missouri since 1883.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., JANUARY, 1925. No. 1.

GENERAL SUMMARY.

The temperature conditions of January, 1925, in Missouri, differed but little from the normal, and there were but few sudden temperature changes of importance. It was mainly less cold in the eastern half of the State than in the western half according to thermometer records, but physiologically there practically was no difference. There were no unusually mild periods at any time or anywhere.

The precipitation was much less than usual, but, owing to ice or snow cover most of the time, the deficiency was not noticed in the general walks of life. The unusual feature, and perhaps the only one of the month, was ice covered ground. Nearly three-fourths of the State north of the Ozarks was ice-covered most of the month. While some of this fell during January, most of it was carried over from the notable December 16-18th glaze and sleet storm. The snowfall of the month was nearly 5 inches for the State as a whole, or about the average. There were no very deep snows, and no drifting of importance.

Winter wheat at the close of the month was in a doubtful state, but the general opinion of the farmers seemed to be on the side of minor damage. Except the necessary chores, farm work was at a stand still. There was little or no activity in highway building or outdoor work of any kind. The automobile, gasoline, and nearby lines of trade also were adversely affected by the weather. On the other hand, woolens, rubber goods, especially shoes, skates, and sleds were in great demand.

TEMPERATURE.

The monthly mean temperature as shown by the records of 66 stations, was 29.7°, or 0.7° below the average for the State for the past 38 years. The month was a bit milder than normal in the northeastern and southeastern sections, and colder in the central, southwestern, and northwestern sections. The 13th, 27th, and 28th were the coldest days generally, subzero cold being more or less widespread on those dates. The relatively mild periods were from the 3d to the 9th, and from about the 21st to the 25th, and the 30th. The 24th, and 25th were the warmest days and the only two of the month for the State as a whole with minimum temperature above freezing. The maximum for the month was 65°, on the 24th; the minimum was 15° below zero, on the 28th.

PRECIPITATION.

The average for the State as determined from the records of 99 stations, was 1.00 inch, or about 1.03 inches less than the 56 years' average. Precipitation was below normal in all sections, being somewhat more pronounced over the eastern half of the State. There was ample soil moisture, however, for all needs. About three-fourths of the State was ice covered most of the month, being a continuation of the December glaze storm. Most of the month's precipitation was in the form of light snows, mixed with rain, and occasionally with sleet or glaze. The periods of the most general precipitation were 1st, 12th, 15-16th, 19th, and 26th to 29th.

The average snowfall was 4.7 inches; and it fell in all sections. In the Ozarks the monthly totals ranged from about 5 to over 11 inches, and in other sections from about 2 to 7 inches.

WIND.

The prevailing winds were from the south and southwest. The total monthly movement, 8 stations equipped with anemometers reporting, was 6,438 miles, and average hourly velocity of 8.7 miles. There were no strong winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 184, or about 62 per cent of the possible, and about 11 per cent more than normal. The sunshine this month was about 6 per cent more than last January.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---8th, 16th, 22d, and 25th.

Halos, solar.---13th, 20th, 24th, 25th, 27th, 28th, and 31st.

Halos, lunar.---7th, 8th, 9th, 20th, 29th, 31st.

Sleet.---In eastern and southern sections 1st, 11th, 15th, 19th, 26th; western sections on 15th, and 16th. Generally light, except heavy in the southeastern part on the 26th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for January, 1925.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., FEBRUARY, 1925. NO. 2.

GENERAL SUMMARY.

There was very little real winter weather during February, 1925, in Missouri. In the main the month was mild, the mildest since 1921, and about the fourth warmest of record. The precipitation was less than normal in all sections, save the northwest, where it was a bit wetter than usual; the snowfall was light, amounting to about 30 per cent of the normal. There were no unusually high winds anywhere in the State. All rivers remained well within banks.

Three-fourths of the wheat area had been covered with ice from about the middle of December to well into January, and the plants remained dormant during February. The root system was good, and while there was no apparent injury to plants, there was little or no response to the warmth and sunshine of the mildest days. Water from the slowly melting ice and snow of January, with February's precipitation kept the ground too wet for any start in farm work, save some little plowing in the extreme southeast. The highways as well as the country roads were in bad condition most of the month, causing some slacking up in the automobile business lines. Most of the business and traffic lines of trade, however, were not much affected one way or the other by the weather. Commercial orchards were dormant, the buds apparently being in satisfactory condition.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 60 stations reporting, was 38.7°, or about 7° higher than the 36-year average; about 5° warmer than last February, and the fourth warmest February of record. The temperature excess was about the same in all sections. The first two days and the last three days of the month were typical of real winter; the period from the 10th to the 17th was variable, but unusually mild weather prevailed from the 4th to 9th, and 18th to the 25th. During the warmest periods several days were balmy and spring-like, with afternoon temperatures in the 70's. The first two days and the 27th were the coldest, the minimum, 1°, occurring at Tarkio, Atchison County, on the 2d. Minimum readings of 32° or lower occurred on about 20 days.

PRECIPITATION.

The monthly precipitation, based upon the records of 93 stations, was 1.85 inches, or about 0.30 inch less than the 56 years' average. It was drier than normal in the southeastern lowlands, Ozark Plateau, and about normal in the northeastern plains. The most general precipitation occurred from the 9th to the 11th, and 21st to 23d. There was some moisture during the first and last weeks but was rather light and scattered.

The snows were light and less frequent than usual for February. The average fall for the State was under 2 inches; the heaviest amounts, from about 3 to 5 inches, as a rule, fell over the eastern half of the State north of the Ozarks; 9 inches in Lewis County was about the heaviest monthly total.

WIND.

The prevailing winds were from the south. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 6,818 miles, 10.2 miles an hour. Brisk winds occurred generally on the 8th, 10th, and 11th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, based upon the records of 6 well placed stations equipped with sunshine recorders, was 176. This is about 56 per cent of the possible and about 4 per cent more than normal. There was about 1 per cent less sunshine than during the same month last year.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---1st, 6th, 7th, 8th, 23d, and 24th.

Hail, light, local.---On the 8th.

Halos, solar.---3d, 5th, 10th, 12th, 13th, 14th, 18th, 19th, 22d, 26th, 27th, and 28th.

Halos, lunar.---5th, 6th, and 7th.

Sleet or Glaze.---Light 1st, 10th, 16th, and 28th.

Thunderstorms.---8th, 20th, 21st, and 22d.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for February, 1925.

VOL. XXIX. COLUMBIA, MO., MARCH, 1925. No. 3.

GENERAL SUMMARY.

March, 1925, in Missouri, was, as a rule, marked by uniformly mild temperatures, much bright weather, and rather light precipitation. The only adverse feature, which fortunately was local, was the destructive tornado of the afternoon of the 18th, in the southeastern part of the State.

The first few days were cold, but about the 6th, a change to milder weather had occurred, and mainly pleasant conditions prevailed from then to the end of the month. There were 17 clear days, making in this feature almost a record for March.

The precipitation was less than normal in all sections. The snowfall was scanty. In the southwestern part of the Ozark Plateau, in Barry and adjoining counties, it was about the driest March of record. However, in nearly all of the State the total monthly moisture was sufficient for early spring needs.

The month's weather was favorable for winter and spring grains, and orchards. It also favored live stock, farm, and highway work, and other outdoor occupations. The automobile and other trade lines were favorably affected.

TEMPERATURE.

The monthly mean temperature for the State, 64 stations reporting, was 47.7°, or 3.9° above the 36-year normal, and something more than 9° warmer than the same month last year. It was the warmest March since 1921, and seventh warmest of record. The only real cold weather prevailed during the first two or three days; on the 2d temperatures ranged from around zero to 8° or 10° above, generally. On and after the 6th the weather was mainly mild. Afternoon temperatures reached into the eighties on the 8th, 9th, and 23d. The extremes were 5° below zero, at Amoret, on the 2d, and 86° above zero, at Mexico on the 9th. There were only about 13 days with minimum temperature of 32° or lower.

PRECIPITATION.

The monthly precipitation for the State, 98 stations reporting, was 1.95 inches, or about 1.05 inches less than the 56 years' average. The month was drier than usual in all sections, the deficiency in moisture being more marked in the southeastern lowlands and Ozark Plateau than elsewhere. The precipitation was heaviest and somewhat more frequent during the second decade; and rather light and scattered the first 10 days and after the 20th.

The snowfall was unusually scanty for March, most of the month being too warm for snow. The average monthly fall for the State was less than 1 inch; there were some local amounts of 2 inches.

WIND.

The prevailing winds were from the south. The average monthly movement, 8 stations equipped with anemometers reporting, was 9,435 miles, or about 11 miles per hour. Winds of from 40 to over 50 miles an hour occurred on the 3d, 18th, 20th, and 26th. A destructive tornado passed over parts of Reynolds, Iron, Madison, Bollinger, and Perry Counties the afternoon of the 18th. See page 13.

SUNSHINE AND CLOUDINESS.

There were 17 clear days, as compared with 8 in last March. The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 270. This is about 73 per cent of the possible, 18 per cent more than normal, and about 33 per cent more than March, 1924.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---5th, 13th, 17th, 18th and 19th.

Hail.---At Bolivar, Lockwood, and Seymour on the 18th. Arcadia, and Farmington on the 26th. No damage.

Halos, solar.---1st, 4th, 6th, 7th, 9th, 12th, 17th, 20th, 21st, 23d, and 24th.

Halos, lunar.---3d, 6th, and 9th.

Sleet, light.---Seymour on the 4th, and 11th. Arcadia, and Springfield on the 11th.

Thunderstorms.---13th, 17th, 18th, and 26th.

Winds.---At Downing, and St. Catharine, a high wind on the 20th, blew a roof of a store building at the former, and blew tops off smoke stacks at the latter place. Damage several hundred dollars.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

DESTRUCTIVE TORNADO OF SOUTHEAST MISSOURI MARCH 18, 1925

One of the most destructive tornadoes of recent years occurred in Southeast Missouri the afternoon of March 18, 1925. Comfortable homes, and barns were blown down, many being practically "reduced to kindling wood"; numbers of live stock were killed, and valuable forests laid waste. Fortunately, perhaps, one-half or more of the country the storm traveled is sparsely settled. A total of eleven persons was killed, upwards of 150 injured, many seriously, while the property loss will exceed $500,000.

A few minutes before 1 p. m. of March 18, Mr. W. F. Haywood, postmaster at Ellington, Reynolds County, observed a blue-black cloud mass several miles to north-northwest of his home. To Mr. Haywood, the premonitions of an unusual storm—an incipient tornado—were clearly evident. Becoming alarmed, he started for the local school house for his children, but he soon noticed that the storm had started east, away from the school house; at the same time the cloud had become partly obscured by a fog or mist. A little later one of the rural carriers of his office came in, reporting that he had barely missed the storm by taking the proper precaution, and had seen the storm go east, crossing Logan's Creek and dry valley, about four miles north of Ellington, as "a twister." A few minutes after 1 p. m., it was seen by Mr. Obia Neel, as it swept east and one and one-half miles south of Redford, a settlement in Reynolds County, and about seven miles east-northeast from the point of origin. Mr. Neel reports that the cloud was funnel-shaped, with rotary winds, throwing objects in every direction. From Logan's Creek to south of Redford, the storm's track averaged about one-fourth mile wide. One person was killed, two injured, and property was destroyed to the amount of about $5,000.

What the storm did between Redford, Reynolds County, and Annapolis, Iron County, is not known. It struck the village of Annapolis and its immediate vicinity with terrible force at 1:15 p. m. It nearly swept that village from the earth. The confusion and terror was reported as indescribable. The damage there is estimated to be fully $400,000; but, remarkable as it may seem, only two persons were killed, and 25 seriously injured.

From Annapolis the tornado advanced east-northeast. For nearly 40 miles of its track, from Annapolis, Iron County, across Madison County and into Bollinger County, there were no eye-witnesses, except we know that the storm past near and south of the little settlement of Cornwall, in the northeast angle of Madison County, and on the St. L. I. M. & S. R. R., at about 1:30 p. m., causing damage to the amount of $1,000, but neither killing nor injuring any persons. The next place struck was at or near the Crossroads, Bollinger County—a place where Highways No. 9 and No. 51 cross—about 5 miles south of the north boundary line of Bollinger County. From there onward the storm passed through a well-settled, prosperous farming section, the damage being continuous on about eight farms contiguous to the settlements of Crossroads, Sedgewickville, Alliance, Schuemer Springs, and Lixville, in Bollinger County. In this strip of country four persons were killed, 91 injured, and property damaged to about $45,000. The tornado crossed over into Perry County, reaching the village of Biehle at about 2 p. m., making the distance of 50 miles, from Annapolis to Biehle, in 45 minutes. There is evidence of a double track just after entering Perry County, about one-half mile west of Biehle, the two tracks continuing, in diminished intensity, for about three miles, and then again as one track, with increased energy. From Biehle the storm swept, retaining its rotary movement, 30 farms or more, contigous to the settlements of Biehle, Uniontown, Brazeau, Frohna, Altenburg, and Wittenberg. In this strip of country, about 20 miles long, 4 persons were killed, 38 seriously injured, and property damaged to the extent of $113,000. The storm crossed the Mississippi River about three miles north of Wittenberg, at 2:30 p. m. A representative of the Perry County Sun, Perryville, Perry County, followed over the storm's path in Bollinger and most of Perry County. He says he "felt incapable of giving a true description of the devastation and ruins." "Persons stand and gaze at the ruins in wonder and astonishment—wonder how it is possible that entire families escaped without apparent injury, and astonished how entire families covered up under the wreckage were not killed."

From the point of apparent origin, near Ellington, Reynolds County, to the point where it crossed the Mississippi River, the storm traveled, sweeping the earth as a whirling mass most of way, (and probably all of the way), 85 miles, within the time of 90 minutes. This rate of travel is no doubt correct, as it may be noted that where ever the cloud was seen and time recorded, the rate of progress was about the same. The path of greatest destruction varied somewhat, but averaged about one-fourth mile wide. There does not seem to be any doubt about the storm being a true tornado.

We wish to here thank our cooperative observers and the postmasters of Southeast Missouri, and also the Perry County Sun, Perryville, Mo., for splendid cooperation in making it possible to follow the path of this storm.

Recapitulation.

	Persons killed	Persons injured	Property loss
Reynolds County—			
Ellington (near)	1	2	------
Redford (near)	0	0	$5,000
Iron County—			
Annapolis and vicinity	2	25	$400,000
Madison County—			
Cornwall (near)	0	0	$1,000
Bollinger County—			
Crossroads, Sedgewickville, Lixville, Schuemer Springs, and adjacent rural districts, 8 or 10 farms	4	91	$45,000
Perry County—			
Biehle, Uniontown, Brazeau, Frohna, Altenburg, and Wittenberg, and adjacent rural districts, 30 farms	4	38	$113,000
Totals	11	156	$564,000

Written for the Climatological Data, March 1925, based on all available data to April 10, by George Reeder, Section Director for Missouri.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., APRIL, 1925. No. 4.

GENERAL SUMMARY.

April, 1925, in Missouri, was warm. Only two Aprils in the past 35 years or more were warmer. On the morning of the 5th and again on the 30th, minimum temperatures were around 32° at a number of stations in central and northern sections, but there was no real freeze at any time. As a whole, the month had above normal temperatures in all parts of the State, the excesses being quite uniform and rather large, averaging around 6° a day. Much of the month had warmth approximating the usual for the first part of June.

The frost of the 30th was general, save in the extreme Southeast. It was not killing by any means, but nipped and set back the more tender vegetation, which was unusually well advanced.

The rainfall was somewhat greater over the western and central sections than over the eastern sections. It was not too heavy in the first two, and was about enough for needs in last named part; altogether, the distribution and frequency were satisfactory. There were some thunderstorms with squalls and hail.

The month was very favorable for the usual spring farm work, and grains. It was good for ranges and stock; for highway and other outdoor building interests, as well as the general lines of trade.

TEMPERATURE.

The monthly mean temperature for the State, 64 stations reporting, was 61.0°, or 5.9° higher than the 36-year normal. Only two Aprils since 1888 were warmer. The temperature distribution was uniform, all sections showing about the same plus departures. Until the last few days, the prevailing warmth was comparable with that of early summer, especially from about the 10th to the 26th of the month. The last two days were abnormally cool, with light frost generally, save in the extreme Southeast. Just before the reaction to cool weather, afternoon temperatures ranged from 85 degrees to 92 degrees.

PRECIPITATION.

The average precipitation for the State, 94 stations reporting, was 4.11 inches, or about 0.38 inch more than the 56 years' average. The month was wetter than normal in the western half of the State, and dryer than normal in the eastern half, and especially the east-third, from the Missouri River south. Showers fell with the usual April frequency, but there were no excessive downpours. The greatest local monthly fall was 8.14 inches, at Milan, and the least was 0.67 inch, at Maryville. The greatest amount in any 24 consecutive hours was 3.51 inches, at Seligman on the 25th.

WIND.

The prevailing winds were from the southeast. The total movement, 8 stations equipped with anemometers reporting, was 7,615 miles, 10.6 miles an hour and about 9 per cent above the average. There were no heavily damaging storms, but brisk to strong winds occurred on the 13th, 14th, 19th, 20th, 21st, 23d, 25th, 29th, and 30th.

SUNSHINE AND CLOUDINESS.

There were 12 clear days. The average number of hours of sunshine, 6 well placed stations reporting, was 255. This is about 64 per cent of the possible and about 5 per cent more than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---At Hannibal on the 18th.

Frost, light.---1st, 5th, 6th, 28th, 29th, and 30th.

Hail.---At St. Louis and Fayette and the 13th; Warsaw 14th; Downing 19th and 21st; Brunswick 21st, and 25th; Louisiana, St. Catharine, and Tarkio, on the 21st. No damage reported.

Halos, solar.---2d, 4th, 6th, 8th, 16th, 17th, 18th, 19th, 21st, 22d, 23d, 25th, 26th, and 28th.

Halos, lunar.---1st, 2d, 3d, and 8th.

Thunderstorms.---2d, 3d, 7th, 8th, 12th, 14th, 15th, 17th, 18th, 19th, 20th, 21st, 23d, 25th, 26th, and 27th. General on the 9th, 13th, 16th, and 24th.

SPECIAL STORM NOTES.

April 7.—During a heavy thunder and rain storm, Joseph Reardon, a farmer, near Clarksdale, Dekalb County, was killed by lightning at about 5 p. m. Roads were made nearly impassable by the heavy rain but no other damage was done.

April 8.—Rather a severe hail storm occurred at and in the vicinity of Republic, Greene County, at about 7:15 p. m. The storm came from the west-southwest. Stones were as large as peas to marbles; the path was about one-half mile wide. Damage was considerable, mostly to orchards. Loss about $5,000.

April 20.—An unusually heavy rain and hailstorm occurred in the vicinity of Napier, Holt County, about 8 p. m. Rain and hail fell for about 30 minutes; size of stone from one to [illegible] inches; the path of the storm was about one-half mile wide. Burlington passenger train No. 22 from Omaha, due at St. Joseph at 8:55 p. m. was held up at Napier, by the storm. Windows were broken by hail driven by high wind. Some old roofs were penetrated by hailstones. Gardens and fruits were the principal crops damaged. Estimated loss several thousand dollars.

On the same date and about the same time, a heavy thunderstorm squall struck the southern part of Chillicothe, Livingston County. Roofs of some homes were blown off; silos blown down, and some other minor damage was done. Loss not estimated.

April 24.—During a thunderstorm, in the evening, John Hunt's barn, northeast of Seymour, Webster County, was struck by lightning and burned, with all its contents, including much corn, a team of mules, and some farm machinery. Loss about $2,000.

April 25.—During a severe thunder and rainstorm at and in the vicinity of Perry, Ralls County, John Adkinson, a farmer, was struck and instantly killed by lightning, at about 1:15 p. m. The father, H. A. Atkinson, who was standing near, was knocked down by the same bolt but not killed.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano Salem, R. F. D. No. 5.

Daily Precipitation for April, 1925.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., MAY, 1925. No. 5.

GENERAL SUMMARY.

Viewed as a whole, the month of May, 1925, averaged cooler and drier than the normal. But taken in parts it was, to use a popular expression, "a freaky month;" one in which seemingly the coal-man, the ice-man and the lawn mower were in a combine, for they all were in demand, and mostly at the same time.

The outstanding features were the near winter temperatures of the 2d, 19th, and 25th, and some really hot weather from the 21st to the 24th. On the 2d, and 19th minimum readings ranged below 40° along the southern border, and generally at low frost values in northern sections. With respect to extremes of temperature, both high and low, the period from the 21st to 25th, inclusive, was probably the most remarkable in the history of the Missouri Climatological Service. From the 21st to the 23d excessive heat prevailed with some record breaking temperatures for the season; the warm wave was quickly followed by a cool wave that overspread the entire State by the morning of the 25th, attended by record breaking minimum temperatures, and heavy to killing frosts in all sections, save the extreme southeast, for so late in May. The change in temperature during this relatively short time was from 55° to 70°.

The main crops, corn, wheat, and tree fruits, were not seriously damaged; and most of the less hardy crops made marked recovery. The month was favorable for outdoor occupations.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 61.2°, or 3.4° lower than the 36 years' average, and about 2.6° higher than the mean for May, 1924. The first 20 days were mainly cooler than normal. The last ten days were marked by extremes, both high and low occurring in this period. Afternoon temperatures ranged in the 90's on the 21st, 22d, and 23d, and on the morning of the 25th there were some record breaking minimum temperatures for so late in May, freezing or near freezing being general, accompanied by heavy to killing frosts---killing to many of the less hardy crops---in all sections from and north of the Ozarks. The range was 72°, from a maximum of 98° on the twenty-third to a minimum of 26° on the twenty-fifth. The minimum for the month, however, was 24°, at Unionville on the 2d.

PRECIPITATION.

The average precipitation for the State, 98 stations reporting, was 2.14 inches, or about 2.56 inches less than the 56 years' average. It also was the driest May since 1914. While the month was much drier than usual in all sections, the deficiency was more marked along the eastern and northern borders. Showery spells, however, along with relatively low temperatures, prevented any adverse crop effects, except most vegetation in the southeastern counties was at the stage where good rains were needed to prevent deterioration.

WIND.

The prevailing winds were from the south. The average wind movement was 6,303 miles, based upon the records of 8 stations equipped with anemometers. The hourly velocity was about 8 miles, or slightly less than the usual. Strong winds occurred on the 15th, 16th, 21st, 22d, 24th, 29th, and 31st.

SUNSHINE AND CLOUDINESS.

The number of clear days was 14, four more than last May. The average number of hours of sunshine was 310, or about 70 per cent of the possible and about 7 per cent more than normal.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---6th, 9th, 10th, 12th, 14th, and 19th.

Frost, light.---1st, 2d, 5th, 6th, 12th, 18th, and 27th.

Frost, heavy to killing.---25th (Killing to gardens and truck, but not the main crops).

Halos, solar.---2d, 3d. 5th, 6th, 9th, 10th, 11th, 12th, 13th, 15th, 23d, 25th, and 28th.

Halos, lunar.---2d.

Hail.---At Kansas City, Mountain Grove, and St. Joseph, on the 13th; Clifton Hill, Mexico and Warrensburg, 15th; Brunswick and Chillicothe, 16th; Arcadia and Hailey, 23d; Dean and Houston, 24th.

Thunderstorms.---20th, 21st, 23d, 28th 29th, 30th, and 31st.

SPECIAL STORM NOTES.

May 13.---A heavy hail storm occurred about 11 miles southeast of Springfield, Mo., at about 10 a. m. The hail was heavy, and about the size of playing marbles. Considerable damage was done to gardens and orchards.

May 16.---Thunderstorms, accompanied by heavy rain, high wind, and hail, crossed the State from west to east during the evening and early night. There was some damage at St. Joseph; and the railroad trains were delayed for a short time. At Boonville, there was about $50,000 wind damage, and from $75,000 to $100,000 wind damage at Columbia; at Mexico streets and basements were flooded. There was no damage of consequence reported east of Audrain County.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for May, 1925.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., JUNE, 1925. No. 6.

GENERAL SUMMARY.

June, 1925, was mainly a warm month although without any extremely hot days. While probably too steadily warm from the physiological side, it was on the other hand a fine summer month from the view point of the agriculturalist---plenty of warmth, plenty of sunshine and moisture. It had its adverse side, however. There were too many thunderstorms with attending squalls, and too many local hailstorms. The damage resulting from these storms was somewhat heavier than during the usual June.

As a rule the weather was favorable for farming interests. It rained and stormed only occasionally during the first half of the month, giving the farmer ample time to cultivate his crops. At the close of the month the corn crop probably was never in better condition for the time of season. Wheat and hay harvest and other work was carried on without any serious hindrance.

The main rivers were running a few feet under bankful stages, but some of the tributaries went out of banks, destroying a relatively small acreage of corn and wheat in the bottoms.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 67 stations reporting, was 76.5°, or about 3° higher than the 36-year normal. In the southeastern lowlands the temperature excess averaged about 5° a day; in the northwestern plateau it was less than 2° a day, while in other sections the daily excess averaged around 3°. The last week was cooler than normal but the first 20 days or more were mainly warmer than normal, ranging from 1° to as much as 14° a day. Afternoon temperatures reached 90° or higher on 15 days, 100° to 103° occurring at six stations; these extremes, however, are well under those of June in some other years.

PRECIPITATION.

The precipitation for the State as a whole, 99 stations reporting, was 6.10 inches, or about 1.43 inches more than the 56 years' average. It was wetter than normal in all sections, save the Ozark Plateau, though only 12 stations reported minus departures, and most of these were confined to a relatively narrow strip extending from about Miller County southward to the state-border. During the first ten days or more the rains were infrequent and moderate; the last half of the month was wet. A rather dry spell in the southeastern part of the State was broken by excessively heavy rains on the 13th, from 5 to over 8 inches falling within less than 24 hours. Considerable damage resulted from overflowed creeks and small rivers. The greatest monthly amount was 12.55 inches, at St. Joseph.

WIND.

The prevailing winds were from the south. The average wind movement, based upon the records of 8 stations equipped with anemometers, was 6,689 miles, 9 3 miles an hour and about 10 per cent more than normal. Brisk to strong local winds occurred on a few days, the highest velocity reported being 55 miles from the northwest at St. Louis, on the 29th; the next highest was 42 miles at Columbia, on the 17th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 324, or about 73 per cent of the possible, and about 3 per cent more than normal. This June had 5 per cent more sunshine than the same month in 1923, and 10 per cent more than June, 1924.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---At St. Joseph on the 19th.

Hail, more or less damaging.---Brunswick on the 15th; Farmington, 23d; Marshall, 27th; Mexico. 28th; Tarkio, 28th, and 29th.

Thunderstorms.---1st, 2d, 3d, 6th, 7th, 9th, 12th, 13th, 15th, 16th, 17th, 18th, 19th, 22d, 23d, 24th, 26th, 27th, 28th, and 29th.

SPECIAL STORM NOTES.

June 3.—St. Joseph, Mo., and its vicinity, experienced one of the worst rainstorms in recent years during the early morning hours. In less than five hours 6.31 inches of water fell. There was great damage to city property by flooded sewers: to the roads and field crops. The St Joseph newspapers estimate the damage at $100,000. Heavy rains fell in adjacent counties, but the main damage was confined to Buchanan County.

June 7.—A small tornado-like storm passed over Rockport, Atchison County, at about 4 p. m. It came from the southwest and moved toward the northeast. Most of the damage was confined to blowing over small outhouses, and barns, toppling off chimneys, and uprooting trees. Damage estimated at $7,000.

June 17.—A severe electric storm occurred at about 9 p. m. in Columbia, Boone County. Rainfall was excessive but there was no hail. Wind, rain, and lightning did damage in the city to the amount of $1,200. Nearby creeks flooded lowlands destroying the crops.

June 27.—A severe hailstorm crossed from northwest to southeast over parts of Atchison, Nodaway, and Andrew Counties, between 8 and 10:30 p. m. Considerable damage was done to crops at Fairfax, Graham, and Fillmore. At the last place it was the most severe hail of recent years. The path of damage was about two miles wide and eight miles long, and the storm lasted about 20 minutes. The stones were as large as hen eggs and some as large as baseballs. Some hogs were killed, and many persons bruised and otherwise injured by the stones; much damage was done to windows of houses and automobiles, and even roofs of houses were pierced. The greatest damage occurred to the crops. Fields of fine corn, wheat and oats were absolutely wiped out. The hail in places was six inches deep; and in low shaded spots did not melt for two days. It is difficult to place the damage, but it has been estimated as high as $100,000. During the same evening quite severe hail fell locally in Cooper, Boone, and Audrain Counties, resulting in much damage to crops.

Strong thunderstorm squalls, with some resulting property damage, occurred at Brunswick on the 1st, and 15th; at Downing on the 15th, at the same time lightning struck and burned a barn; some barns were struck and live stock killed at Avalon on the 15th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for June, 1925.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., JULY, 1925. No. 7.

GENERAL SUMMARY.

July, 1925, was considerably drier than normal in Misouri, and there was more than the usual amount of sunshine. But probably the most strange feature of the month's weather was its temperamental quality. This midsummer month was divided into halves, the first part of unusual hotness and the other of pleasant coolness, some days, and particularly the last week, compared favorably with early autumn weather. During the early part of the month temperatures soared up around the 100 degree value frequently, while during the latter end they rarely reached 90° and frequently failed to reach 80°. The last week averaged cooler than any other similar period since 1883.

While the rainfall was not adequate for all purposes, the prevailing cool weather during the latter part of the month slowed down evaporation and otherwise mitigated drought effects. At the close of the month corn conditions were irregular and ranged from poor to excellent, but mostly good. It was well advanced, being in the pollination stage generally. It was a good month for outdoor occupations, traffic and utilities.

TEMPERATURE.

The temperature for the State, as determined from the records of 68 stations, was 77.9°. This value agrees within a half degree of the 36-year normal. The northern half of the State averaged slightly cooler than normal; the Ozarks slightly warmer, while the average daily excess in the southwest plain, and southeastern lowlands was 1.1° and 2.6°, respectively. The first part of the month was hot and the latter part relatively cool. Unusually warm weather prevailed the first week, with day temperature reaching and exceeding the 100° value generally, and especially in the southwestern plain. The highest was 106°, at Clinton on the 8th. The last week of the month was unusually cool. From the 28th to the 31st the minima were quite generally from 53° to 46°; and this is about the record for the last days of July, though lower temperatures have occurred in the past during the first part of the month.

PRECIPITATION.

The precipitation for the State as a whole, 103 stations reporting, was 2.71 inches, or 1.34 inches less than the 56 years' average. There was a deficiency in all sections, most marked in the southwestern plain, and less marked in the Ozark Plateau. There were no general rains or well defined rainy periods. Some quite heavy local showers occurred on the 6th, 20th, 21st, and 26th; 3.25 inches was the heaviest 24-hour fall, at Steffenville, on the 6th. It was, taking the whole State, the driest July since 1921.

WIND.

The prevailing winds were from the southwest. The average movement based on records of 8 well placed stations equipped with anemometers was 5,246 miles, 7 miles per hour, or about 4 per cent less than normal. A few local high winds (thunderstorm squalls) occurred on the 6th, and 9th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, based upon the records of 6 stations equipped with sunshine recorders, was 347, 77 per cent of the possible and somewhat more than normal, and about 7 per cent more than July, 1924.

MISCELLANEOUS PHENOMENA.

Halos, solar.---7th, 11th, 12th, 17th, 20th, 21st, 22d, 25th, 27th, and 31st.

Halos, lunar.---3d, 4th, and 31st.

Hail.---At Edgerton, Louisiana, and St. Charles on the 25th; no material damage.

Thunderstorms.---General, 4th, 7th, 9th, 14th, 20th, 25th, and 26th. Local, 2d, 3d, 5th, 6th, 8th, 10th, 11th, 12th, 13th, 19th, 24th, 27th, 29th, and 30th. Thunder was heard and recorded on as many as 14 days at some stations.

Lightning struck the fine residence of R. M. Chaffin on farm about three miles northeast of Seymour, Webster County, about 10 o'clock at night of July 25th, causing a fire that destroyed the entire building and most of its contents. Loss about $10,000; insurance $2,000.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for July, 1925.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

Vol. XXIX. Columbia, Mo., August, 1925. No. 8.

GENERAL SUMMARY.

August, 1925, in Missouri was about normal in all main climatic elements for the State as a whole, except sunshine which was considerable more than usual; but was to an unusual degree variable in the several sections. It was wetter than usual in the northern half of the State, with some large local amounts. In southern sections and especially the southeastern and southwestern divisions it was very dry and hot. August was mainly cool in the first half and hot the latter half, reversing the conditions prevalent in the preceding July. There were some local thunderstorm squalls but no damaging storms.

The month was mainly favorable for crops, save in most of the southern sections, where it was too dry for late planted crops and pastures. In ten or more of the southwestern counties having Benton and Hickory as the center, and much of the Ozark Plateau and southeastern lowlands, the lack of moisture this month taken in connection with the shortage in July was not productive of the best results in farm operations. Early planted corn, however, was far advanced toward maturity and was not seriously affected. There was not much plowing for fall seeding done in the dry sections, but made the usual progress elsewhere.

TEMPERATURE.

The monthly mean temperature for the State was 76.5° or about 0.5° higher than the 36-year normal. The northern half of the State, and the Ozarks differed but slightly from the usual, but it was noticeably warmer than the normal in the southwestern plain and the southeastern lowlands because it was much drier in those parts. Temperatures alternated above and below the normal the first half of the month. Hot weather began about the 18th, and the last week was continuously hot. The extremes, 107° and 45°, are quite within the limits of other years. About half of the days had 90° or higher.

PRECIPITATION.

The precipitation for the State, 99 stations reporting, was 3.45 inches, or 0.23 inch less than the 56 years' average. The month's moisture was unevenly distributed. From the Missouri River northward there was quite a large excess, while over the southern half of the State there was a marked deficiency, drought conditions being pronounced at the end of the month in some 10 or more of the west-central counties. In the northwestern plateau there were some unusually large amounts, 11.24 inches at Maryville, being the greatest. Nearly all of the monthly rain fell during the the first twenty days, the last ten being nearly rainless. The greatest amount in any 24 consecutive hours was 4.26 inches, at Tarkio on the 6th.

WIND.

The prevailing winds were from the south. The average movement based upon the reports of 8 stations equipped with anemometers, was 4,734 miles, or about 6.4 miles an hour, and about 6 per cent less than normal. There were a few strong thundersqualls on the 11th, 12th, 17th, 18th, and 31st.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine for the State, six well placed stations equipped with sunshine recorders reporting, was 340, 80 per cent of the possible and about 9 per cent more than normal. The current month had about 6 per cent more sunshine than August, 1924, and 12 per cent more than the same month in 1923.

MISCELLANEOUS PHENOMENA.

Hail, small, without damage.---Clifton Hill, 10th; St. Louis University, 12th; Gano, 16th; Warrenton, 19th. At Seymour on 17th small damage to corn and fruit. At Maryville severe electrical storm with hail night 16th.

Halos, solar.---6th, 13th, 15th, 16th, 17th, and 19th.

Halos, lunar.---5th, and 31st.

Thunderstorms.---Local, 2d, 3d, 4th, 6th, 8th, 9th, 13th, and 15th. More or less general on the 7th, 10th, 11th, 12th, 16th, 17th, 18th, 19th, and 20th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for August, 1925.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., SEPTEMBER, 1925. No. 9.

GENERAL SUMMARY.

September, 1925, in Missouri, was the warmest September of record, though, to be sure, it was only three-tenths of a degree warmer than the same month in 1897. That one, however, is the only September since 1888 that closely compares with the current month in warmth. The first ten days of this month constitute one of the outstanding hot periods, regardless of months. Afternoon temperatures soared around the 100° value almost daily and generally, and there was no break in the heat until the the rains along about the 10th or 11th. This September had another unusual feature, and that was, while hot it also was wet, rather a rare combination. This can be explained, however, by showing that most of the excess in temperature occurred early in month and most of the rainfall the latter half of the month.

Dry weather with hot winds caused some suffering to crops, especially in southern sections where summer drought had been locally serious. But when the rains did set in they were frequent, generous to copious, with some unusually excessive downpours. Failing wells and dried up streams were fully replenished and the soil was soaked. The usual seasonal farm work was suspended.

TEMPERATURE.

The monthly mean temperature for the State, 69 stations reporting, was 74.6, or 5.6° above the normal for 36 years. It was the warmest September of record, and more than 10 degrees warmer than the same month in 1924, though that month was an unusually cold September. The hottest weather of this summer occurred during the first ten days of the current month. Afternoon maxima ranged around and above the 100° value almost daily. About seven stations along the northern border had extremes of a degree or two below 100°, but the average for State was 5 days, about 3 or 4 north of the Missouri River and 7 to 10 south. The maximum for the State was 110°, at Jackson. This is about the record, 109° being the highest previously.

PRECIPITATION.

The average precipitation for the State, based upon the records of 102 stations, was 6.46 inches. The departure from the 56 years' average was plus 2.73 inches, and the largest excess since 1921. There was no rain the first week and the first general rain did not occur until the 10th to the 14th, and the most frequent and heavy rains followed from this period on. Excess moisture fell at all stations, save at six or eight in the northeastern plain and two or three in the southern sections. Some large amounts fell on the 11th, 3.80 inches at Kirksville, 4.50 inches at New Madrid, 4.30 inches at Downing, and 4.44 inches at St. Joseph. The second date of heavy falls was the 21st, when 4.10 inches fell at Bolivar, 3.52 inches at Houston, 8.92 inches at Lockwood, 5.29 inches at Seymour, 4.00 inches at Clinton, 4.28 inches at Warsaw, and 4.32 inches at Nevada.

WIND.

The prevailing winds were from the southwest. The total wind movement, based upon the records of 8 stations equipped with anemometers, was 5,437 miles, or an hourly velocity of 7.6 miles. This is about normal. There were a few local high winds on the 8th, 10th, 11th, and 30th.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 234. This is about 58 per cent of the possible and about 10 per cent less than normal. The same month in 1924, had 8 per cent more sunshine than the present month.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---12th, 14th, 15th, and 16th.

Hail.---Severe, near Steffenville, Lewis County, on the 7th. Light, without damage, at Koshkonong, Oregon County, on the 9th.

Halos, solar.---5th, 7th, 8th, 18th, and 24th.

Halos, lunar.---24th, and 30th.

Thunderstorms.---6th, 7th, 8th, 9th, 10th, 11th, 20th, 25th, 26th, and 30th.

SPECIAL STORM NOTES.

A severe hailstorm occurred near and south of Steffenville, Lewis County, Mo., on the 7th. The path was about two miles wide and ten miles long, and in a general direction from west to a little north of east. The stones were as large as "good size marbles". Chickens were killed, and other damage was done. Some corn was badly torn up, but the garden truck suffered most. Estimated loss about 15,000.

A windstorm, described as "a miniature twister" struck Mexico, Mo., at 3 p. m. of the 8th. The general trend of the storm was from southwest toward northeast; less than five miles long and about one-fourth mile wide. No great damage resulted. A small shed and garage on the A. P. Green Fire and Brick Plant were destroyed, two men being injured. Telegraph wires of the C. & A. Railway were broken, halting traffic for a time. The Wabash station was struck by lightning. Small sheds were flattened out and porches torn down. The estimated damage was put at $10,000.

A thunderstorm squall at Gorin, Scotland County, damaged outbuildings, sheds, and the like; stripped fruit trees, and tangled up corn. Loss about $3,000 to buildings, $1,000 to crops. At Downing, twenty miles northwest, the same storm, but earlier in the day, was felt but without damage, except a valuable cow owned by John Leeds, was killed by lightning; value about $80. This was afternoon and night of 10th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5. * * * +10.55

Daily Precipitation for September, 1925.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

L. XXIX. COLUMBIA, MO., OCTOBER, 1925. No. 10.

GENERAL SUMMARY.

ne could not very well pick out any one outstanding weather feature October, 1925, in Missouri. All the main elements were more or less ew or abnormal. As a usual thing October in Missouri is a fine asant month, and one possessing much economic value, in as much here is open weather for accomplishing fall farm work, and other oor occupations, and the necessity for heating homes is kept down a minimum. Now and then an October is bad. But the current nth was, to use a public expression, "horrid".

The month was cloudy, wet, and cold. The coldest October of record d it runs close to being the wettest, certainly the cloudiest. The first ee days were quite balmy. But nearly every day thereafter was colder n normal, some as much as 20 to 25 degrees colder. The first general st and freeze occurred on the 10th; the second on the 19th, with ing almost nightly thereafter. A cold wave with snow swept the te the night of the 27th, followed by winter cold; for forty to seven-ive consecutive hours the temperature did not rise above 32°. On morning of the 30th zero cold was recorded in the northern-border nties. According to our records this never has occurred before.

Corn gathering was delayed by wet weather and very little was bbed; down corn was damaged. Wheat seeding was dragged out over ng period and at the close of the month less than one-half of the crop in the ground. Much late forage was damaged. On the other hand, s of winter clothing and household fuel were brisk.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, s 48.6°, or 8.8° lower than the 36-year average. It was the coldest tober of record, beginning in 1888. Except the first three days of the nth and locally on the 13th, every day was colder than normal, the ly deficiency running as high as 25°, the average for the month being ut 10°. Real and severe winter weather prevailed the last week. mperatures fell to zero and lower at the north-border stations, and m 12° to 20° above to the extreme southern limits of the State, on the h. The minimum was 3° below zero, at Grant City and Unionville. is is the first zero cold ever recorded in October, according to our rds; 11° above in 1913, being the coldest before this year.

PRECIPITATION.

The average precipitation for the State, 101 stations reporting, was 5 inches. The departure from the 56 years' average was plus 2.10 hes. Only four other Octobers since 1867 were wetter than the current nth, namely in 1877, 1881, 1883, and 1919; several others, however, e nearly as wet. All sections received more than the normal precipi-on but the excess moisture was much less marked in the western f than the eastern half of the State. Not more than three consecutive s passed without some rain. The southeastern lowlands received far most rain. the total for the month being considerably more than ble the usual; the greatest local monthly amount was 11.44 inches, Dexter.

Snow fell on the 28-29th, with appreciable snow cover everywhere; the al depths ranged from near 2 inches in the southern sections to 3 hes in the northwest section.

WIND.

The prevailing winds were from the north. The average monthly vement, 8 stations equipped with anemometers reporting, was 6,254 es, an hourly velocity of 8.4 miles, or about normal. There were high or damaging winds, except locally in Macon County.

SUNSHINE AND CLOUDINESS.

There were only 8 clear days. The average number of hours of sun-ne for the State, based upon 6 well placed stations equipped with shine recorders, was 132. This is about 38 per cent of the possible, ut 28 per cent below normal, and 41 per cent less than October, 1924.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---1st, 3d, 12th, 13th, 14th, 16th, 24th, 30th, and 31st.
Frost, light to heavy on the 9th.
Frost, killing.---On the 10th generally.
Hail.---Small hail fell at a few stations on the 2d, 3d, and 23d. No mage.
Halos, solar.---15th, 22d, 23d, and 27th.
Halos, lunar.---10th, and 28th.
Sleet.---Some little sleet fell on the 9th, 27th, and 29th.
Thunderstorms.---1st, 2d, 3d, 4th. 14th, and 23d.

SPECIAL STORM NOTES.

At about 1 p. m. on the 4th quite a severe storm occurred at Atlanta, Macon County. The newspapers referred to it as a "tornado", but after investigation it seemed to have been a thunderstorm squall. The width of the path was one to one and a fourth miles, and about twenty miles long. No twisting winds were observed nor funnel-shaped cloud. The path of damage was one-half to three-fourths mile wide. The general trend of the storm was from northwest toward southeast. The attending hail was about the size of playing marbles; some few stones being reported as large as "hen eggs". The damage to buildings was confined to unroofing buildings, blowing down chimneys, etc. Damage put at about $5,000. Crop damage, principally by hail, was estimated at about $1,500.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used determining section or division means.

Reference letters, ᵃ, ᵇ, ᶜ, appearing in the table indicate number of days missing; for example, ᵇ, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gan

Salem, R. F. D. No. 5.

Daily Precipitation for October, 1925.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., NOVEMBER, 1925. No. 11.

GENERAL SUMMARY.

November, 1925, in Missouri, was without any very noticeable weather feature. The month was moderately cold and generally wet, except that less than the normal amount of rainfall occurred over the northwestern section. It was only about 6° colder than October. It normally is about 13° colder; but, to be sure, October, 1925, apparently borrowed considerable weather from December.

Except some real winter weather from the 7th to the 9th, temperatures alternated above or below the normal for several days at a time, the values either way being relatively small, though the negative values were somewhat more pronounced than the positive. For the State, as a whole, the month averaged nearly 2° colder than normal; the coldest November since 1920. It was not as wet, however, as either 1921, or 1922.

There was more rainfall than needful everywhere. This was particularly true in most of the southeastern counties where locally more than double the normal precipitation fell. Snow was general on the 7th, and 15th. It was unusually heavy over the central and northern parts of the State for so early in the season. North of the Missouri River some stations reported 5 to 7 inches of snow; and snow covered the ground from one to four days.

Because of the more or less wet condition of the ground (never having sufficiently dried out since the September rains), the month was generally unfavorable for seasonal farm operations. It was especially unfavorable for the seeding of fall grain over all of the eastern two-thirds of the State. The western-third fared much better. Much of the corn crop was still in the fields at the close of the month. Pasturage was good generally.

TEMPERATURE.

The monthly mean temperature for the State, 67 stations reporting, was 42.8°, or nearly 2° colder than the 36-year average, and 4° colder than November, 1924. The monthly means for the different parts of the State were remarkably uniform, ranging from about 46° in the southeastern low lands to about 40° in the northwestern plateau. The daily values alternated above and below the normal in periods of three or four days, the negative values being a little more pronounced than the positive values. The temperature range was − 2° on the 8th, to 80° on the 26th, both being local. These extremes agree very well with those of past years.

PRECIPITATION.

The average precipitation for the State, 99 stations reporting, was 2.99 inches. The departure from the 56 years' average was plus 0.64 inch, and the wettest of the last three Novembers. The southeast part of the State was much wetter than usual, while the northwest was drier than normal. There were no prolonged rainy periods. The greatest local month fall was 7.75 inches, at Marble Hill, and the least was 0.40 inch, at Conception. The greatest fall in any twenty-four hours was 3.20 inches, at Caruthersville on the 26th.

WIND.

The prevailing winds were from the south. The monthly movement, 8 stations equipped with anemometers reporting, was 6,932 miles, or about 9.7 miles an hour. This is about normal for November. There were no damaging or unusually high winds.

SUNSHINE AND CLOUDINESS.

The average number of hours of sunshine, 6 well placed stations equipped with sunshine recorders reporting, was 196. This is about 65 per cent of the possible and about 8 per cent more than normal, and about 3 per cent less than November, 1924.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—1st, 2d, 11th, and 12th.
Halos, solar.—10th, 11th, 17th, 24th, 25th, and 27th.
Halos, lunar.—5th, 25th, 27th, and 30th.
Sleet.—7th, 14th, and 15th. No damage.
Thunderstorms.—Moderate, 7th, 12th, 14th, and 26th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for Noqember, 1925.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

VOL. XXIX. COLUMBIA, MO., YEAR, 1925. No. 13.

GENERAL SUMMARY.

For the State, as a whole, the weather during the year 1925, in Missouri, was characterized by somewhat more than normal warmth. There were, however, some marked contrasts in some sections, and a few abnormally cold spells. During most of the time from January up to and including September temperatures ran above normal, the accumulated excess amounting to around 700 degrees. At the end of the year it was still more than 300 degrees, the reduction of some 400 degrees occurring during the last three months of the year, and largely during October alone.

Although April and June were somewhat more than normally wet, there was a general deficiency in precipitation for the first eight months. Drought effects were quite marked during a part of July, most of August, and the first ten days of September in most sections south of the Missouri River. This deficiency, though, was more than made up the last quarter of the year from about the middle of September.

The more outstanding features of the year, probably were the favorable farm conditions of March, April, and June; rather a "freaky" and unfavorable May; unstable July; a warm and wet September, and a cold and wet October, with an early snowstorm and zero temperature as chief features.

The weather's most marked adverse affects on agricultural interests probably were the record breaking late May frost; the mid-summer local drought, terminating with hot winds during the first week or ten days of September; and the abnormally wet autumn. After the middle of September the continued wetness delayed the gathering of root and fruit crops, and corn and forage crops; and it not only delayed seeding but cut down the acreage of winter wheat.

TEMPERATURE.

The annual mean temperature was 55.5 degrees, or 0.7 degree above normal. The highest temperature was 110 degrees, at Jackson, on September 6th. This is the State record for September. The lowest was −15 degrees, at Goodland, on January 28th. The next lowest was −10 degrees, at Unionville, December 27th. During the summer there were only seven days with maximum of 100 degrees or higher, and 60 days with 90 degrees or higher. In the winter there were 116 days with minimum of 32 degrees or lower, but only two days with zero or lower.

PRECIPITATION.

The annual precipitation was 39.78 inches, or 0.91 inch more than normal. The heaviest rains fell in June and September. The totals of September and October together amounted to 11.31 inches, which was more than the combined totals of the first five months of the year. The seasonal snowfall was 16.4 inches. It was somewhat heavier over the southwestern and northeast plains than in either the Ozark or northwest sections. The storm of December 4th probably interfered with general traffic more than any other snowstorm, because of the attending driving, drifting winds.

THE WEATHER BY MONTHS.

JANUARY.—The month was drier and a bit brighter than usual, but temperatures differed but little from the normal. The unusual feature was ice covered ground. Nearly three-fourths of the State north of the Ozarks was ice-covered most of the month, most of it being carried over from December. The snowfall was about 5 inches; but there were no deep or drifting snows. The highest temperature was 65° and the lowest −15°. Considerable winter wheat was smothered. There was little or no activity in highway building or outdoor work of any kind.

FEBRUARY.—There was very little real winter weather, most of the month being mild. Many of the days were balmy and spring-like, with afternoon temperatures in the 70's. There was no zero cold, 1° above being the minimum. The precipitation was less than normal; and the snows were light and less frequent than usual for February. Wheat was dormant but the root system was good. Fruit buds were satisfactory. Main highways and country roads generally in bad condition. There was little or no plowing.

MARCH.—Rather dry, mild temperatures and much bright weather prevailed. The only adverse feature, fortunately local, was a severe tornado in the southeastern part of the State on the 18th. Weather generally favorable for winter wheat, spring grains, and orchards. It also favored live stock, farm and highway work, and outdoor occupations generally. The commercial fruit orchards were in satisfactory condition.

APRIL.—A mild favorable month. Much of the month had warmth approximating the usual for the first of June. The usual spring farm work, and grains made excellent progress. Pastures improved rapidly. A frost on the 30th nipped and set back the more tender vegetation which was unusually well advanced for the season. The precipitation was more than the normal, but, as the preceding month of March was rather dry, the soil readily took care of the April moisture.

MAY.—The month averaged cold. It was decidedly a "freaky" month, one in which winter, spring, and summer all played a part. Temperature changes were sudden and marked; frost values prevailed on the 2d and 19th. From the 21st to 23d excessive heat obtained with some record breaking temperatures for the season; this was quickly followed by a cool wave that overspread the entire State by the 25th, attended by record breaking minimum values and heavy to killing frosts in all sections, save the extreme southeast. It was the latest killing frost of record. The main crops were not seriously damaged; and the less hardy crops made marked recovery. Peaches were mainly killed.

JUNE.—Mainly a warm month, although without any extremely hot days. With ample warmth, sunshine and moisture, farm interests were favorably affected. Thunderstorms with attending squalls, and local hailstorms were probably more frequent than usual, but wheat and hay harvest and other work was carried on without serious hindrance. Some of the smaller rivers were out of banks, destroying some wheat and corn.

JULY.—Sunshiny and drier than normal. Something of a of a temperamental month. The first half was unusually hot, while the latter half was pleasant weather, some of it being almost autumn like. The rainfall was not adequate but the cool weather of the last half slowed down evaporation and otherwise mitigated drought effects. Corn ranged from fair to good but mostly good. It was well advanced in the pollination stage.

AUGUST.—Mainly cool the first half and hot the latter half, reversing the conditions prevalent in the preceding month of July. In the northern half it was wetter than usual with some large local amounts. In the southern half it was hot and dry. All late planted crops were badly damaged and many springs and streams dried up, necessitating early shipments of live stock; it also was too dry for plowing for fall grains.

(Continued on Page 54.)

SUMMARY—*Continued from Page 50.*

SEPTEMBER.—About the warmest September of record and about one of the wettest. The first ten days was an outstanding hot period regardless of months. On and after the 10th rains were frequent and heavy. The dry weather with hot winds during the first ten days caused all crops to suffer and deteriorate, the damaged of course being, more marked in southern sections were summer drought had been locally serious. But after the rains set in they were copious, replenishing failing wells and streams and soaking the soil. The adverse feature of the wetness was the necessary suspension of farm work.

OCTOBER.—Cloudy, wet, and cold, the coldest October of record. Frost and a freeze occurred on the 10th, the second freeze followed on the 19th and the remainder was made up of frequent freezes. A snowstorm swept the State on the 27th, followed by winter cold, zero being recorded in northern border counties, and a record for this month. The farmer had a hard time of it. Wheat seeding was dragged out and delayed. Corn and forage were damaged; and all-to-gether it was a miserable month.

NOVEMBER.—The month was without any very noticeable features. Except some real winter weather from the 7th to the 9th, temperatures alternated above or below the normal for several days at a time, the values either way being relatively small. Snow was general on the 7th, and 15th, some stations receiving 5 to 7 inches. There was more rainfall than needful. In the southeast more than double the normal rainfall occurred. It was the third consecutive unfavorable month for the usual seasonal farm work, and especially for the eastern half of the State.

DECEMBER.—A general and heavy snowstorm during the first week, and some real winter cold Christmas week were the outstanding weather features of this winter month. The snowfall was unusually heavy in most central and north-central counties, and drifted badly. Railway trains were delayed, and other traffic was suspended for the time being. Much of the month was favorable for outdoor work.

IN APPRECIATION.

The public spirit, intelligence, and high sense of faithfulness to duty of the cooperative observer of the U. S. Weather Bureau, has many times been written about and commented upon. So it was meet and proper that the American Meteorological Society, when holding its annual meeting, in connection with that of the American Association for the Advancement of Science, at Kansas City, Mo., on December 28 and 29, 1925, should offer and unanimously pass the following motion:

That the American Meteorological Society express its appreciation of the services of the cooperative observers.

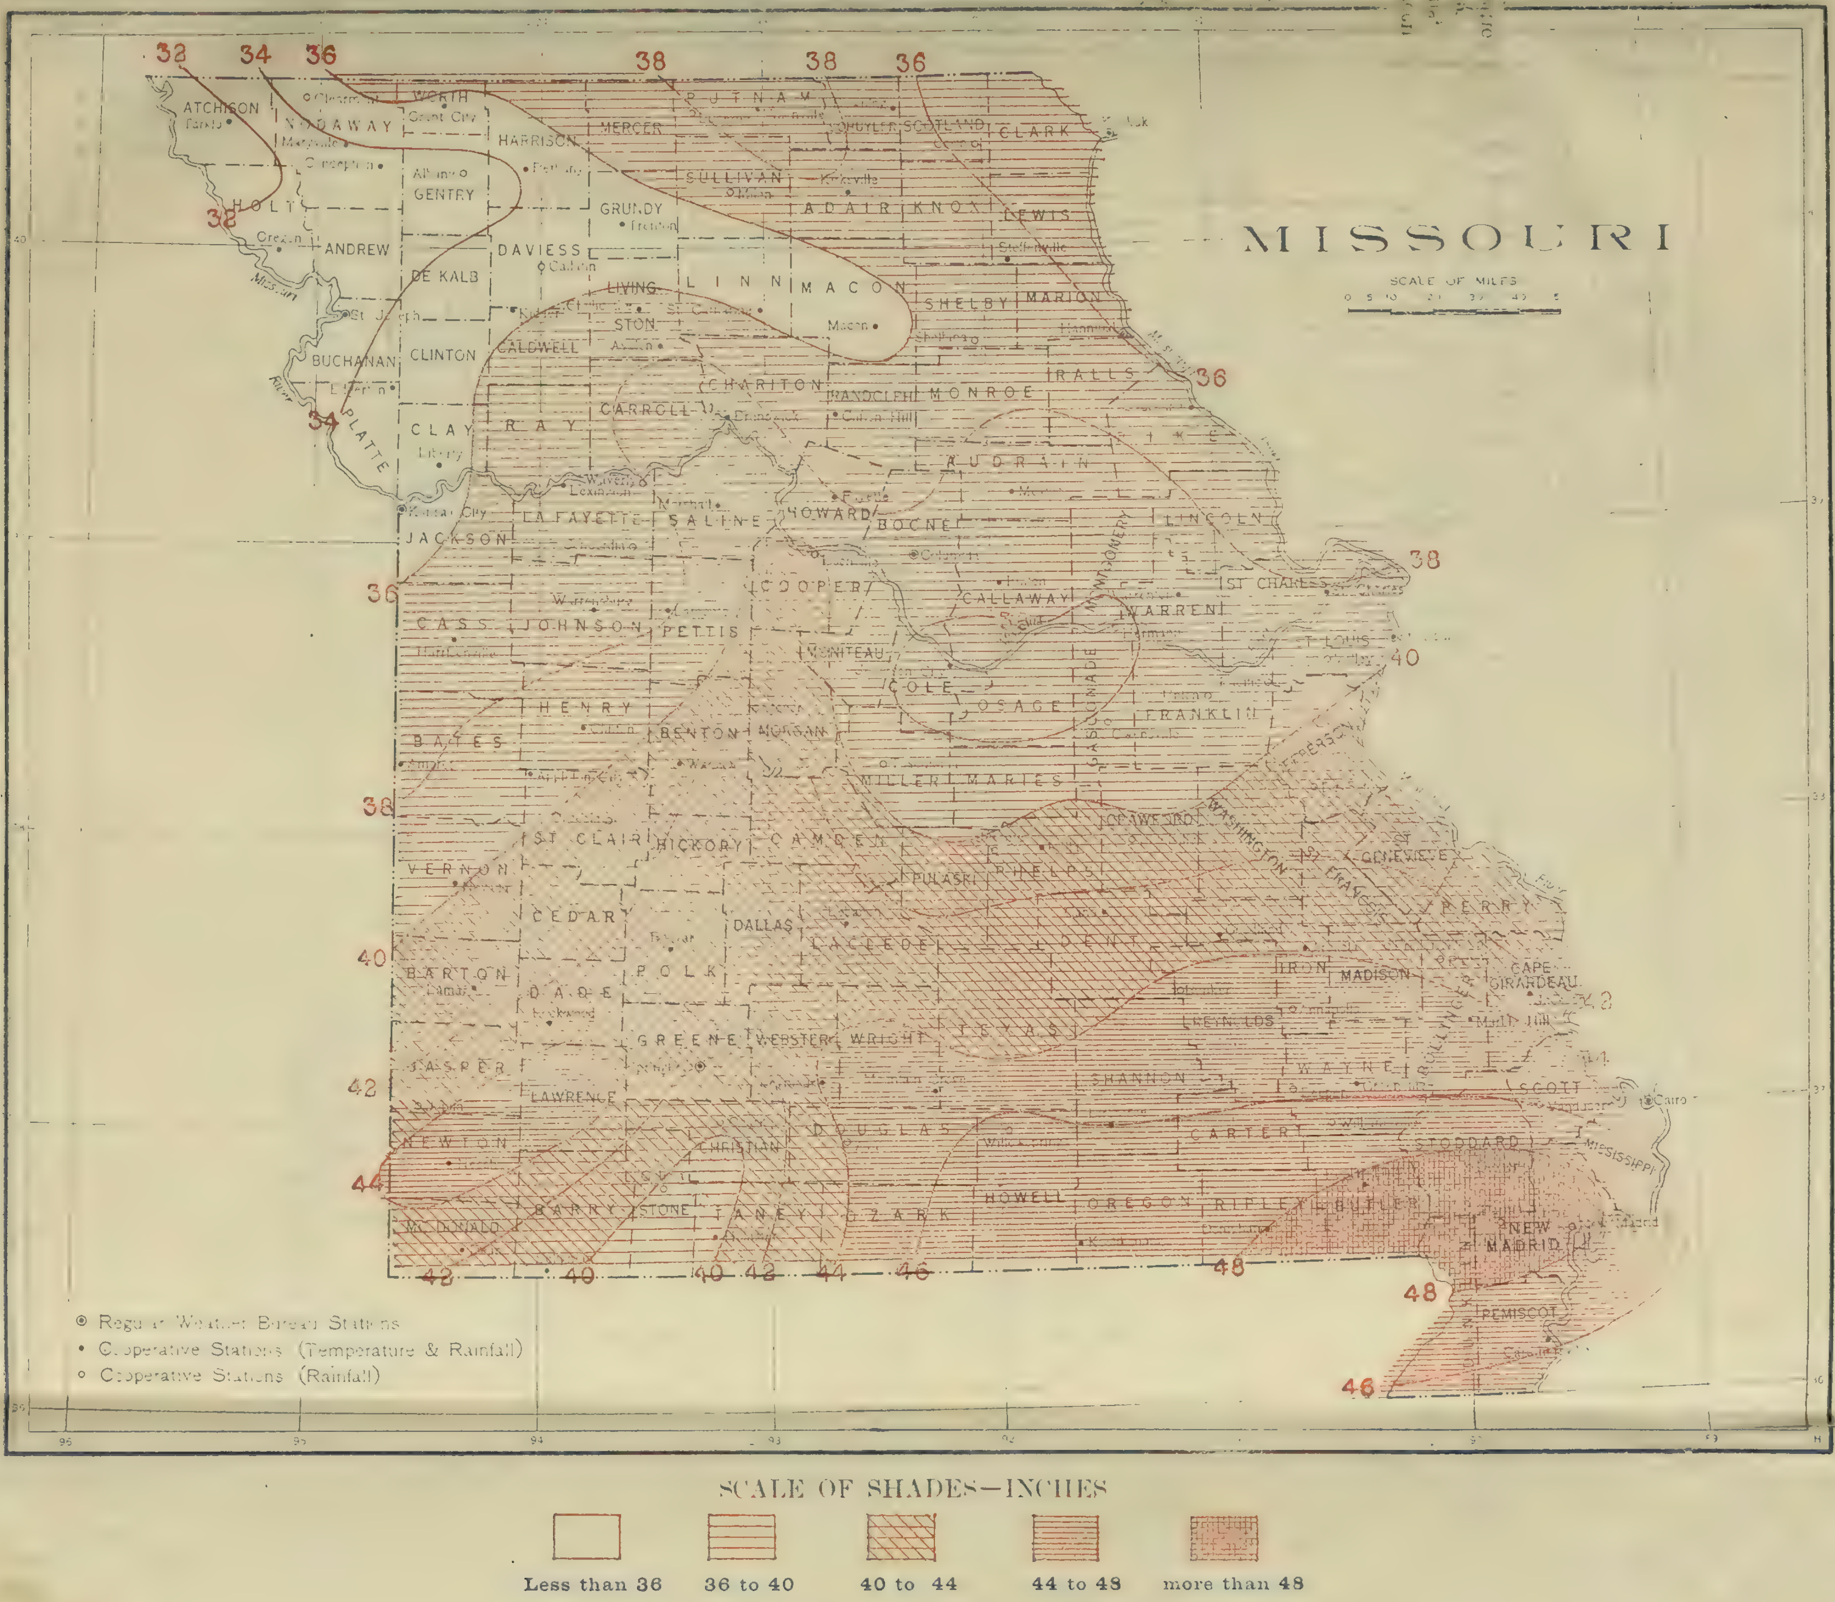
NORMAL ANNUAL PRECIPITATION FOR MISSOURI

Computed from all past records



MS

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

oL. XXX. Columbia, Mo., January, 1926. No. 1.

GENERAL SUMMARY.

The opening month of 1926, in Missouri, was not noticeable for any ry marked or outstanding weather feature. There were only two real nter cold snaps, and these were of less than a week's duration each. ıe first week was much milder than normal, followed by the first cold ap on the 7th. By the 14th the weather was mild again and con- ued moderate up to the 19th. The second cold wave, rather more vere than the first, overspread the State, beginning on the 20th. Mini- ım records of a few years' standing were broken, particularly in the ıtheastern part of the State. There was a rapid and general reaction moderate weather on and after the 26th, the maximum for the nth, 70 degrees, occurring on the 30th.

Precipitation was nearly normal. While mostly light, it was rather frequent for any but the usual outdoor activities, though this side of weather was perhaps less marked in the northwestern section. Tak- the whole month, precipitation was more than normal in the west- ı third, and below normal elsewhere, though there was more actual isture outside of the western part. This comes about, of course, be- ıse of the respective normal values.

nowfall was heavy over the southern-third, scanty in central, and ly moderate over the northern half of the State. Traffic in the Ozark ın was suspended for short time.

Vinter wheat came through the month fairly well; it is small and n in eastern sections, because it was seeded late. There was little or activity on the farms, outside the usual daily chores. Fruit buds e damaged by cold locally. The State Highway work progressd with y slight interruptions. Livestock did well.

TEMPERATURE.

The monthly mean temperature for the State, as deduced from obser- ions of 65 stations, was 32.7 degrees, or about 2.3 degrees warmer n normal. Except quite a sudden and decided change to colder on 22d. and 23d, temperature changes were unimportant as a rule. [illegible] ve swept the State, and was of quite unusual severity [illegible] ern section; minimum readings of 12 to 18 below zero [illegible] and one station, Goodland, recorded 20 below zero. ue from this cold snap relatively mild periods prevailed for a week time during the first and second decades, and also at the closing s of the month. The maximum for the month, 70 degrees, occurred the 30th. There were 25 days with minimum of 32 degrees or lower, only one with zero or lower.

PRECIPITATION.

he [illegible] pitation for the State, as determined from the rec- [illegible] was 1.90 inches. This is only 0.13 inch less than [illegible] age. Over the northeastern plain and southeastern [illegible] n was frequent, falling at about three day intervals, amounts, while quite substantial at times, were not excessive. In Ozarks most of the precipitation fell on the 2d, and 3d, 17-18th, , and 31st. This also would hold true for the southwestern plain, for the northwestern plateau the periods were not so well defined, ppreciable snow flurries falling in between the more outstanding ter periods.

now was heavy in the Ozark Plateau and northern part of the south- lowlands. Maximum depths ranged up to 18 inches at points in Ozarks, while 7 to 11 inches were general to the eastern border. In northern sections depths were from 2 to 5 inches, and somewhat over the central part of the State.

MISCELLANEOUS PHENOMENA.

gs, dense.---On the 3d, 4th, and 5th.

Halos, solar.---2d, 6th, 7th, 8th, 12th, 15th, and 19th.

Halos, lunar.---1st, 2d, 8th, 21st, 22d, 25th, 26th, 30th, and 31st.

SPECIAL NOTES.

Sleet occurred at Neosho on the 17th, and at Lexington on the 20th, and at Amoret, Louisiana, Jackson, Morehouse, Arcadia, Farmington, Mountain Grove, Seymour, and Nevada on the 21st. No damage reported.

At Appleton City, snowdrifts from the storm of December 4, remained on the ground until January 29.

It is reported that the low temperatures of the 23d, probably killed most of the peach buds at Farmington and other adjacent points.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano Salem, R. F. D. No. 5.

Daily Precipitation for January, 1926.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., FEBRUARY, 1926. No. 2.

GENERAL SUMMARY.

February, 1926, in Missouri, was markedly and persistently mild, with normal sunshine, and about normal precipitation. Except a day or two during the second week, and on the 18th and 19th, temperature changes were mainly unimportant, and there was little real winter cold. The prevailing mild weather probably was largely due to the absence of the usual February snows. Some high winds prevailed on several dates, the most outstanding gale being on the 18th, attended by snow. There was no material damage anywhere.

Except the hard-finished main highways, roads were in bad condition, and trade between farm and city was mostly conducted by means of horse-drawn vehicles. Highway work and other outdoor occupations, as well as most business and traffic lines were somewhat adversely affected by the month's weather.

Farm work was delayed, except it made some progress in the southern third of the State; and winter wheat and grass began to green and show some little growth in southern sections. The commercial fruit orchards have not been materially injured by freezes.

TEMPERATURE.

The monthly mean temperature for the State, as a whole, 62 stations reporting, was 39.4 degrees, or nearly 8 degrees above the normal. This mean has been equaled once, (1915) and exceeded once, (1921) since the beginning of records in 1888. The day temperatures were not as high as usual but the minimum readings were higher than the normal for February. The extremes, 76 degrees and — 4 degrees, are well within those of other years. The zero cold was brief, occurring at one station on one day. There were only about 15 days with minimum of 32 degrees or lower.

PRECIPITATION.

The monthly precipitation, based upon the records of 98 stations, was 2.08 inches and about normal for the State as a whole. This element, however, was not so evenly distributed as the temperature. The northern half of the State was a little wetter than the southern half, though some of the heaviest local amounts fell in the latter division. Probably the most outstanding rainy spells were the first two days, 14th to the 19th, and 24th to the 26th. About two inches fell within 24 consecutive hours at Doniphan, and Lamonte, on the 18th; and at Goodland, and Greenville, on the 25th.

The snowfall was very light for the State as a whole, and it did not remain on the ground. There were a few heavy local falls, particularly in Jackson County where 12 inches fell, 8 inches in Lafayette, 7 inches in Saline, 12 inches in Linn and Randolph, and 7 to 8 inches in Shelby and Marion Counties.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—1st, 2d, 3d, 11th, 13th, and 18th.

Halos, solar.—4th, 5th, 6th, 7th, 8th, 11th, 13th, 16th, 20th, and 21st.

Halos, lunar.—4th, 18th, 20th, and 21st.

Thunderstorm.—13th, 14th, 17th, 18th, 24th, and 25th.

SPECIAL NOTES.

Sleet was general on the 18th, and local on the 14th, 25th, and 26th, but was not of a damaging character.

During the general snowstorm of the 18th, a strong northerly gale was an added feature, beginning in the early morning and continuing until late afternoon. The snow was very much drifted, and, by piling up in sheltered places, interferred somewhat with public traffic. The maximum velocity, as recorded at Kansas City, was 58 miles an hour. There was no damage.

During the night of the 24th a high wind caused some damage in parts of New Madrid County. A few silos were blown down, small tenant houses damaged and a few trees blown down. Damage and loss about $500.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for February, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., MARCH, 1926. No. 3.

GENERAL SUMMARY.

In Missouri, the first, second and fourth weeks of March, 1926, were persistently colder than normal, but the period from about the 15th to the 24th was relatively mild. The month was about normally wet, but the precipitation was somewhat more frequent and heavier over the eastern half of the State.

The spectacular feature of the month was the general and heavy snowstorm that prevailed from the 29th to the 31st. From the Ozarks northward embracing three-fourths of the State, amounts ranged from about 6 to over 14 inches. Quite high winds attended the snowfall, causing much drifting to depths of 4 to over 6 feet, and resulting in the most extensive blockades of highways in recent years at this time of the season. No actual destruction of property was reported.

The usual farming operations were retarded by frequent rains and too much cool weather, especially the last week, when field work usually is well underway. Wheat made little growth but was not injured; some of the late sown was thin and poor with outcome uncertain. All farm roads were in bad condition and the usual business intercourse between town and country was mainly carried on by means of horse-drawn vehicles.

The apple and strawberry crops were not damaged although a part of the peach crop in the southern counties was injured by low temperatures. All garden and truck planting was delayed.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 63 stations was 39.6 degrees, or 4.2 degrees below the normal, and about 8 degrees colder than the same month last year. From about the 15th to the 24th temperature changes were mainly unimportant and most of the time above normal, with a few quite markedly mild, pleasant afternoons. The first two weeks and the last week were outstandingly cold. For the month, as a whole, there were 25 days with minimum of 32 degrees or lower in the northern counties; about 21 days in the central counties, and 16 days in the southern counties. The 13th was a widespread cold day, with minimum values ranging from 8 degrees to 11 degrees above zero. The afternoon temperatures of the 23d and 24th ranged from 75 degrees to 80 degrees and higher.

PRECIPITATION.

The monthly precipitation, based upon the records of 100 stations, was 2.89 inches, and slightly less than the normal. The deficiency was somewhat more marked in the northwest section and in most of the Ozark Plateau than in other parts of the State. Over the eastern half of the State some precipitation, little or much, fell almost daily, but in other divisions there were intervals of several days of fair weather between the set wet spells.

SNOWFALL.

The outstanding feature was a general snowstorm that began on the 29th and continued into the 31st. Depths were unusual for so late in the season, and because of the high attending winds, there was much drifting, and the greatest tie-up of general traffic known in many years for so late in the month. From about Vernon County north to the Missouri River thence east and northeast to Pike and Lewis Counties depths on a level ranged from 10 to 14 inches, but there were drifts of from 4 to more than 6 feet. Highways were blocked. R. F. D. Carriers were unable to make their routes; railway trains were delayed and all automobile movements were suspended. Outside of the loss occurring as the result of suspended business of the traffic lines, there was no direct damage or loss reported. The telegraph and telephone companies were not noticeably handicapped by the storm.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---4th, 10th, 11th, 20th, 22d, and 30th.

Hail.---Few small stones fell at Neosho and Seligman on the 19th, and Warrensburg on the 26th.

Halos, lunar.---21st, 26th, and 27th.

Halos, solar.---9th, 21st, and 27th.

Sleet.---light without damage, at Amoret on the 1st, and Seymour on the 10th, 14th, and 31st.

Thunderstorms.---6th, 19th, 20th, 22d, 30th, and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for March, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., APRIL, 1926. No. 4.

GENERAL SUMMARY.

In Missouri, the weather conditions during April were specially remarkable. All of the State was considerably colder and drier than normal; and all vegetation as well as farm operations were very backward.

Real winter weather prevailed as the month opened over practically all of the State, with heavy general snow over the northern half. While the first few days were the coldest, there was no reaction to normal warmth during the first half of the month, and there were only a few relatively warm days during the latter half. Killing frosts occurred late in the month, but, owing to the backward condition of vegetation, there was little damage.

Plowing made some progress in southern section but very little planting was done because of the cold condition of the soil. Wheat made little growth and in most fields plants were thin. Oats seeding was not completed until the last days of the month.

The main fruits were kept back by the prevailing low temperatures and the condition was general satisfactory. The commercial strawberry crop was two weeks later than last year.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 49.9°, or 5.2° below the normal. It was the coolest April since 1907. The first half of the month was persistently cold, with the daily temperature deficiency ranging from about 6 to 20°. The last half was not much warmer, though there were five or six days with normal or above normal warmth. The 17th and the 30th were the only real warm days of the month, with afternoon temperatures in the 80's. The first was the coldest day generally, with minima ranging from 11 to 23° above zero, from north to south.

PRECIPITATION.

The monthly precipitation for the State, based upon the records of 99 stations, was 2.46 inches, or about 1.27 inches less than the 56 years' average. The deficiency was marked in all sections, but the rains were somewhat heavier and more frequent in the northeastern plain. The main rain periods were from the 1st to the 11th, and 22d to the 24th, and they were general for the State as a whole, but the duration and amounts probably were less conspicuous in the western sections. There was practically no precipitation from about the 12th to the 20th.

SNOWFALL.

An unusually heavy snowstorm prevailed over the northern half of the State on the 1st and 2d, especially the latter date. Depths ranged from 6 to more than 20 inches. By the evening of the 2d snow covered the ground from about 12 to 18 inches generally, while in Adair, Linn, and adjacent counties, the snow lay 20 to 24 inches deep, and drifted into gullies, railroad cuts, and other such places to several feet deep. The snowdrifts, partly a hang-over from the closing days of March, did not disappear until April 20th.

MISCELLANEOUS PHENOMENA.

Aurora.---Observed at several northern stations the evening of the 15th.

Fogs, dense.---2d, 6th, 15th, 22d, and 23d.

Frost, killing.---12th, 13th, 15th, and 19th. Little damage owing to backward vegetation.

Halos, lunar.---20th, 21st, 24th, 26th, and 28th.

Halos, solar.---8th, 14th, 21st, 22d, 26th, and 27th,.

Sleet.---2d, 5th, and 6th.

Thunderstorms.---2d, 5th, 6th, 7th, 17th, 22d, 23d, and 27th.

SPECIAL NOTES.

A strong wind, having some features of the tornado, advanced northeastward from Charitan County to Marion County, the evening of the 23d. At Keytesville, Charitan County, a few barns and poultry houses were blown down, along with some telephone poles. No persons or animals killed or injured. Damage put at about $3,000.

A hard thunderstorm with high wind occurred at Hannibal between 5 and 6 p. m. of the 23d, probably the same storm that was felt at Keytesville, about 88 miles to the southwest, earlier in the afternoon. However, no trace of storm damage could be found in between Keytesville and Hannibal, though quite high wind was mentioned by several reporters. The damage done in Hannibal and vicinity was considerable, probably about $12,000, mostly covered by wind-storm insurance. One person was slightly injured. The damage was confined to buildings.

During thunderstorms, accompanied by high wind, small hail fell for short time at Eldon and Warrensburg on the 6th; at Seymour on the 23d, and at Louisiana on the 24th. There was no damage.

A dust storm, caused by a westerly gale, swept the western border and thence across a part of the northern section of the State on the 27th. Outside of some personal discomfort there was no harm done.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for April, 1926.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

L. XXX. COLUMBIA, MO., MAY, 1926. No. 5.

GENERAL SUMMARY.

he weather of May, 1926, in Missouri, was not quite so radical in its iations as characterized the same month in 1925, although during e current month there were periods in which the elements quite rkedly swung away from the usual. Most of the first ten days and e final ten days of the month were noticeably warmer than normal, ile the second and third weeks were decidedly cooler than normal in of the State.

Taking the month as a whole, the average temperature was more than legrees higher than the 36-year normal, and nearly 6 degrees warmer an last May, though most of the excess warmth resulted from the hot al ten days. The temperature distribution was in just the reverse om the usual, that is, the northern border counties were relatively armer than the southern counties. Light frost was general on the 15th, e result of rather low temperatures for May; owing to a backward op season there was little harm done.

May brought less rain than usual. The monthly fall for the State, as whole, was 2.73 inches, while the usual for this month, as based upon years' records, is nearly 5 inches. The redeeming feature in this pect was the timely and generous rainfall of the last three days, ich amounted to about 50 per cent of the entire monthly total.

May weather was not very favorable for crop development, the pro- ess being ten days or more behind the usual year. Oat, grasses, and rawberries felt the lack of moisture more than other crops. Field ork, highways, and other outdoor occupations, as well as the automo- le and most trade and traffic were favored by the prevailing weather.

TEMPERATURE.

The monthly mean temperature for the State, 69 stations reporting, s 67.0 degrees, 2.4 degrees warmer than the normal, and nearly 6 de- ees warmer than May, 1925. Most of the first and last decades were arkedly warmer than the normal, while the remainder of the month eraged about 6 degrees a day cooler than normal. There was some al cool weather during the middle of the month, frost being general the 15th, with temperatures ranging from 32 to 35 degrees in all parts the State. Owing largely to a very backward season there was little no damage. Midsummer heat obtained from the 26th to the 29th, th maxima ranging from 96 degrees to 100 degrees; and this is close but does not quite equal the record for May in other years.

PRECIPITATION.

The average precipitation for the State, 103 stations reporting, was 73 inches, or about 1.97 inches less than the 56 years' average. The onth was drier than normal in all sections, but the lack of moisture as more noticeable in the western than in the eastern sections. There s, as a rule, very little rain during the first week, and from about the th to the 28th. The principal rains fell during the last three days of he month, and amounted to about 50 per cent of the entire monthly il. There were some generous to excessive amounts on the 31st, 5.80 ches falling at Dean; other heavy falls were; Goodland, 2.90 inches; reenville, 3.00; Hailey, 4 inches; Neosho, 3.73 inches. The greatest onthly amount was 7.82 inches, at Dean, McDonald County, and the ast was 0.40 inch, at Kidder, Caldwell County.

MISCELLANEOUS PHENOMENA.

Aurora.---On the 9th, at Hannibal.

Frost, light.---On the 15th and more or less general but without amage.

Hail.----See Storm Notes.

Halos, lunar.---18th, 20th, and 25th.

Halos, solar.---2d, 4th, 5th, 6th, 7th, 9th, 12th, 13th, 16th, 20th, 21st, d, 25th, 26th, and 30th.

Thunderstorms, local.---2d, 7th, 11th, 16th, 19th, 26th, and 27th. ore or less general, attended by squalls.---8th, 9th, 17th, 18th, 21st, 9th, 30th, and 31st.

SPECIAL STORM NOTES.

Thundertorms with attending squalls and small hail occurred at ppleton City, Lexington, near St. Catharine, and Warrensburg, on he 8th. At Oregon, and Seymour on the 9th. Gano, 17th; Lockwood, 9th; Neosho, 22d. Hail of small marble size and with some some amage to tender vegetation fell at Caruthersville on the 9th, and at reenville on the 18th.

Severe hail accompanied a thunderstorm in Mississippi County, Mo., on May 9th. The storm started about 10 miles southwest of Charleston, about 4 p. m., and advanced east-northeast and crossed the Mississippi River into Kentucky. In Missouri the area averaged about one mile wide. The stones varied in size from bird eggs to hen eggs, averaging probably about the size of walnuts; at Charleston they were as large as hen eggs, with some icicle forms of 5 or 6 inches long.

The damage to crops probably was about $10,000, being somewhat moderate owing to the late season. The damage to buildings and tangible property was probably $50,000. There was high wind, but the amount of wind damage can not be separated from the damage by hail.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for May, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., JUNE, 1926. NO. 6.

GENERAL SUMMARY.

June, 192~~5~~6 in Missouri, was mainly cool for a summer month. It was, as a rule, in marked contrast with the preceding month of May, and averaged less than 4 degrees warmer, whereas during a normal season June is nearly 9 degrees warmer than May. In the main the temperature deficiency was quite uniform, with some rather low values for the season on the 5th, 18th, 21st, 26th, and 28th. There were, however, some few hot days, notably on the 10th, 12th, and 30th.

Rain was more scanty than usual, but where it fell in ample to generous amounts it was pretty well distributed. Some more or less general rains on the 21st proved to be very timely and satisfying, except in the southeast quarter where persistent drought was unbroken. Some quite heavy local amounts fell during a 24-hour period on the 2d, and 14th; and a relatively few stations, at widely separated points, received monthly totals considerably larger than the normal.

Thunderstorms with attending squalls and hail, were quite frequent, but probably not more so than during other Junes. The most outstanding of these storms are noted further along at the end of the text. All rivers were well within banks.

As a rule the weather was favorable for farming interests, as well as general business, and highway work. Corn was variable in height but made good growth. Wheat improved wonderfully, and harvesting was nearing completion at the end of the month. All, or nearly all, other crops did well.

TEMPERATURE.

The monthly mean temperature for the State as a whole, 69 stations reporting, was 70.9 degrees, or 2.6 degrees lower than the 36-year normal. Although a few stations in the northwest had plus departures the averages for all divisions were quite uniform though for individual stations the departures were more marked in the Ozarks and southern border. In the Ozarks temperatures on the hottest days scarcely reached 90 degrees, while in all other sections they were around the 100 degree value on from one to five days. The extremes were 37 degrees to 101 degrees, being within the extremes of other years.

PRECIPITATION.

The precipitation for the State as a whole, 101 stations reporting, was 3.62 inches, or about 1.05 inches less than the 56 years' normal. The month's moisture was slightly more than the average in most northern sections and deficient elsewhere, though quite well distributed. Drought effects were noticeable in most of the State as the month grew older, but a good rain the night of the 21st relieved the dry conditions, except in the southeast quarter. The showery periods occurred at quite regular intervals, allowing much sunshiny weather in between.

MISCELLANEOUS PHENOMENA.

Hail.—Small, resulting in little or no damage, on one or more dates, at Brunswick, Caruthersville, Clifton Hill, Dean, Eldon, Gorin, Grant City, Lexington, Liberty, Jackson, Marshall, St Catharine, St. Louis, Kansas City, Hannibal, Seymour, and Warrensburg. Quite large hail fell at Gorin on the 24th, resulting in damage to fruit.

Halos, lunar.—None.

Halos, solar.—2d, 10th, 15th, 18th, 21st, 22d, 25th, 26th, and 28th.

Thunderstorms.—1st, 2d, 3d, 4th, 8th, 9th, 10th, 12th, 13th, 14th, 15th, 16th, 17th, 20th, 21st, 22d, 23d, 24th, 25th, 29th, and 30th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ‖Received too late to be included in means and summaries. ††Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for June, 1926.

SPECIAL STORM NOTES.

During the afternoon of June 7th, a hailstorm occurred west of Plattsburg, Clinton County, Mo. The width of the path was about one mile and the length, several miles. Stones were as large as playing marbles. Damage was confined to growing crops, estimated to be around $5,000. Again during the afternoon of the 13th, a severe thunderstorm prevailed at and in the vicinity of Cameron, northeast part of the county. Severe hail fell at about 4.30 p. m., and later, for brief periods. The path was from southwest to northwest at first and later more from the northwest. The path of damage was about three miles wide and several miles long. The stones were said to be as large as medium size walnuts. Loss to crops estimated to be about $10,000; to small buildings about $8,000.

A thunderstorm, attended by severe squalls, passed over the northeastern part of the State the afternoon of the 12th. Damage was done at and in the vicinity of Hannibal, Marion County, and at New London, Ralls County. At the former place the damage was confined to trees; one house was struck by lightning and damaged about $100. At New London plate glass windows were broken, barns and other outhouses were wrecked; one cow and some pigs were killed. Total damage between $6,000 and $8,000.

At Downing, on the 13th, a windstorm blew down chimneys, small houses, trees and telephone poles; damage about $50. During a violent electric storm on the 17th, lightning killed a a mule, valued at $100 and seven sheep valued at $75.

A severe hailstorm swept over a strip of Laclede County, at and in the vicinity of Lebanon, the afternoon of the 25th, accompanying a severe thunderstorm. The storm traveled from northwest toward southeast. The storm path was twenty miles long and three or four miles wide. Hailstones varied in size from playing marbles to small hen eggs, and covered the ground in places to the depth af several inches, and, in favored spots, remained on the ground for two days. Crops on the farms in the path were almost totally destroyed; considerable territory covered passed over was pasture land. The hail was particularly destructive to chickens. Loss to buildings and tangible property, mostly broken windows, young pigs, and chickens, etc., about $500. Loss to crops probably $2,000.

A severe wind, rain, and hail storm occurred between the hours of 2.40 p. m. and 5 p. m. in Scott County. The storm was local, covering territory about 4 miles long by four miles wide, having Sikeston as the center. The wind was high, the rain excessive, 6 inches falling at Sikeston; hail, the size of small marbles to small walnuts, was limited to territory near Sikeston. The degree of damage was severe, but it can not very well be separated. The estimated loss to crops is put at $400,000; other losses at $100,000; many roofs were ruined and windows broken. There was some minor wind damage as far south as Morehouse, and as far north as Benton.

TORNADO.

At about 4 p. m., June 16th, a tornado swept across the northern part of Harrison County, and northwest part of Mercer County, Mo., "leaving desolation, wrecked homes and hopes in its wake." The tornado apparently formed to the southwest of the hamlet of Eagleville, and a little west of West Big Creek, and traveled northeast passing a little north of Cainesville thence across Mercer County to the Iowa line. The path of destruction was from one-fourth to one and one-half miles wide, crossing about forty farms. Persons in the territory where the storm struck agreed that it appeared almost immediately after two ordinary storm clouds had met high in the western sky, one coming from the north and the other from the south. "From the collison of these clouds," says the Bethany Republican" a nearby newspaper, "there emerged a typical tornado, funnel-shaped and twisting cloud-carrying with it far from the ground limbs and trunks of trees as it bore an irregular course a little north of east." While few homes were blown completely away, "hundreds of homes were damaged, many beyond repair; almost all of them were moved from their foundations, their beams split open and their floors warped, and with great gaps in their sides and roofs."

One person, Ira O'Neal, was seriously injured but none was killed. It is quite certain that many lives were saved because the storm occurred in the daytime, and because the nature of the storm cloud was so plain. Limbs of trees and other debris could be seen high in the air for several minutes before the storm reached a certain point, giving persons ample time to seek some safe place, in many instances storm cellars.

The storm was particularly destructive to live stock and chickens. Hundreds of chickens were killed; one woman having a flock of eight hundred, lost all but twenty-three; nearly all fowls were plucked clean of their feathers. There were many narrow escapes from death, and many freakish things were performed by the storm.

Loss of buildings, household effects, live stock, farm implements, etc., closely estimated at from $75,000 to $100,000, probably nearer the latter figure. It is probable crops were damaged to the amount of $20,000.

Vol. XXX. Columbia, Mo., July, 1926. No. 7.

GENERAL SUMMARY.

In Missouri, during the month of July, the several weather elements kept pretty well within the limits of the ordinary. One unfavorable feature, a shortage of rainfall, that had been noticeable in the two preceding months, became more widespread and marked in its effects during the current month.

The sunshine was excessive in the south and about normal in the northern half of the State. The month averaged slightly warmer than normal in all divisions. The first week or more was quite hot; afterward, for about ten days, relatively pleasant conditions prevailed, while the last ten days were characterized by variable temperatures but mainly warm.

At about one-fifth of the stations the July rain was more than the normal, but the larger part of the monthly total occurred during one rain. The deficiency was marked in the east-central counties and in nearly all of the southern half of the State, save the extreme southeast. North of the Missouri River moisture conditions were fairly good.

The month's weather was fairly good for all outdoor activities, except hard labor had to be suspended for an hour or two during some of the hot afternoons. It was favorable for wheat threshing and hay making. Corn on the heavier soils and bottom lands did well, but was badly fired on uplands south of the Missouri River. Plowing for fall grain was retarded by hard, dry ground.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 67 stations, was 78.0°, or about 0.6° above the 36-year normal. The first eight days and last twenty days were mainly warmer than normal generally, while the remainder of the month was cooler than normal, although no marked departures either way occurred. There were several real hot days, however. About 36 stations reported afternoon temperatures of 100° or higher on one day; 27 stations on two or more days; 21 stations on three or more days, and 12 stations on four or more days. The first four days, the 19th, and the 29th were generally the hottest. The maximum was 108°, at Marble Hill on the 2d.

PRECIPITATION.

The precipitation for the State as a whole, 102 stations reporting, was 3.14 inches, or 0.91 inch less than the 56 years' average. There was a deficiency in all sections, amounting to about 0.50 inch in the northern and nearly 1.50 inches in the southern half of the State, except the southeastern lowlands. Drought effects were quite marked in most of the southwestern plain, Ozark Plateau, and the eastern slope from about Ripley northeast to St. Charles County. The rain periods were not well defined, falling mostly as scattered showers. The most general and generous amounts fell on the 8-9th, 22d, 26-27th, and 31st. A few stations received amounts in excess of the normal.

MISCELLANEOUS PHENOMENA.

Hail, light, with little or no damage.—At Edgerton and Warrensburg on the 6th; at Dean on the 7th, and 8th.

Halos, lunar.—10th, and 12th. Solar —5th, and 7th.

Thunderstorms.—Local, 2d, 3d, 4th, 5th, 7th, 10th, 12th, 15th, 22d, 23d, 24th, 25th, 26th, 28th, and 30th. More or less general.—6th, 8th, 9th, 21st, 30th, and 31st.

SPECIAL STORM NOTES.

Quite a severe hailstorm occurred about four miles south of Aurora, St. Lawrence County, on the 4th, at about 6 p. m. The path was less than a mile wide and about two miles long, running in a general direction from west to east. The stones varied in size from playing marbles to small walnuts. The damage, confined to fruits and crops, was estimated to be about $600 to $800.

A severe thunderstorm, attended by excessive precipitation and high wind, occurred at Kansas City on the 8th, beginning about 9:32 p. m. Considerable damage was done by water. Lightning caused a fire that destroyed a roofing plant to the extent of $3,500; and this started a fire that ultimately destroyed a Santa Fe elevator, the loss being put at about $200,000.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5.

Daily Precipitation for July, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., AUGUST, 1926. No. 8.

GENERAL SUMMARY.

August, 1926, was warmer than normal in all of Missouri, and it was wetter than usual in all except the northwest plateau. There were some real hot days but the excess of warmth was largely due to high minima or night temperatures. Probably the latter part of the month when the relative humidity was high was the most uncomfortable from the side of personal comfort.

The general lack of rain during the preceding months continued during most of the first half of August, and all crops were marked by drought effects and particularly the upland crops in the eastern, southern, and northwestern sections. Fortunately, before becoming too serious, the drought was broken by general and copious rains during the latter half of the month.

The deficiency in moisture was more than made up, large excesses occurring at nearly all stations. In the southeastern section the rainfall was more than twice the normal, and resulted in some temporary setbacks.

Thunderstorms were of almost daily occurrence during the latter part of the month, but were remarkably free from the usual attending hail and wind squalls, no damage to crops or property being reported from any section.

August rains came too late to help most of the earlier planted crops, but late corn, sorghums, and legumes were benefited. Pastures made some improvement after the rains, as well as alfalfa and wild hay, and most truck crops. Highway work as well as other outdoor building made slower progress after the rains began.

TEMPERATURE.

The monthly mean temperature for the State, was 77.5 degrees, about 1.5 degoees higher than the 36-year normal and the sixth consecutive warm August. Temperatures were quite uniform in all parts of the State, although the month did average about one degree warmer in the northwestern plateau than in the other divisions because there was more sunshine and less rain in the northwest. There were no prolonged periods of heat, five consecutive days of the last week being the longest. The highest temperatures, however, occurred during the first ten or twelve days. Afternoon temperatures in excess of 100 degrees occurred at one or more stations in all divisions on the 6th, 9th, and 11th. The maximum was 106°, and is not unusual for August. The night values dropped to about 50 degrees on the 25th, but, as a rule, the nights were rather persistently warm.

PRECIPITATION.

The precipitation for the State, 105 stations reporting, was 5.63 inches, or about 1.95 inches more than the 56 years' average. Most of the first ten or twelve days were dry, drought effects being quite marked in most of the eastern, southern, and northwestern counties; but from about or soon after the 12th on up to the 20th rains were frequent, copious, and general, and they were fairly general and heavy occasionally during the last ten days. Excessive amounts fell in the southeastern lowlands and locally in the Ozarks and southwestern plain. Amounts were less than normal and not quite satisfying in St. Louis and Franklin Counties, in the east, and Cass and Jackson Counties, in the west, thence northward to the Iowa border. The greatest rainfall in any 24 consecutive hours was 5.83 inches, at Doniphan. The heaviest monthly amounts were 13.55 inches, at Hollister, 12.71 inches, at Campbell, 11.09 inches, at Parma. 11.82 inches, at Morehouse, and 12.70 inches, at Sikeston. Several other stations in this wet section received more than 7 inches.

MISCELLANEOUS PHENOMENA.

Fogs.—4th, 5th, 15th, 17th, 18th, and 19th.

Hail.—Small (no damage) at Edgerton on the 19th, and Lebanon and Warrenton on the 20th.

Halos, lunar.—16th.

Halos, solar.—5th, 6th, 8th, 13th, 18th, 19th, 20th, 22d, and 29th.

Thunderstorms, local.—1st, 2d, 6th, 10th, 11th, 14th, 15th, 18th, 21st, and 22d. General.—12th, 13th, 16th, 17th, 19th, 23d, 29th 30th, and 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for August, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., SEPTEMBER, 1926. No. 9.

GENERAL SUMMARY.

The weather of September, in Missouri, differed in some respects quite widely from the usual. The outstanding features were the persistent and heavy rainfall over all the State, save a few of the extreme southeastern counties, and quite a nipping frost over the northern counties on the 26th.

During the period of more than 50 years that Missouri has been quite well covered by rainfall reporting stations, there had been no higher September rainfall marked than 7.67 inches, but this September exceeded 8 inches, 8.79 inches, in fact, for the State as a whole. Thirty-five stations recorded more than 10 inches, the greatest monthly fall, 18.04 inches, occurring at Maryville, Nodaway County. This was not only the wettest September of record but it runs close to the wettest of all other months, being exceeded only by the records of one May, one June, and one July.

With soil already saturated by the August rains and most creeks and small rivers full, the September rains caused unprecedented floods for autumn. Coming at a time when the principal crops had matured, the damage and loss can scarcely be told.

The frost of the morning of the 26th resulted in little damage, and fortunately, there were only a few local windstorms.

TEMPERATURE.

The monthly mean for the State, as shown by the records of 67 stations, was 69.3°, or only 0.3° above the normal. The divisions known as the southwestern and northeastern plains were practically normal; the northwestern plateau was more than 1° cooler than normal, while the Ozarks and southeastern low lands were 1° and 3°, respectively, warmer than normal. From about the 14th to the 23d was the most steadily warm period of the month, although the highest temperatures occurred at some stations on the 2d and 8th. A decided drop in temperature occurred on the 26th, when freezing and near freezing values were recorded at the more northern stations, and light frost values at nearly all other stations. The minimum was 27°, at Unionville, Putnam County. Tender vegetation suffered somewhat, but overcast sky before early morning prevented any serious damage.

PRECIPITATION.

The average precipitation for the State, as shown by the records of 100 stations, was 8.79 inches, or more than 5 inches greater than the 56 years' average. It was not only the wettest September of record but was very nearly the record for all the months. It being exceeded only by the records of July, 1875, June, 1877, and May, 1896. The excess was marked in all sections, save the southeast which was less than one inch wetter than normal. Five stations in the north received more than 10 inches; fifteen stations in the northeast, three in the Ozarks, one in the southwest, and nine in the northwest recorded totals of 10 inches or more, 18.04 inches, at Maryville, Nodaway County, was the greatest. There were not many excessive amounts in any one day, however; 5.83 inches, at Hannibal, on the 3d-4th, 4.68 inches, at Neosho on the 4th, ond 4.40 inches at Maryville on the 15th, were the heaviest amounts reported.

In the northern half of the State rain fell on every day, except the 7th, 10th, 11th, 17th, 18th, and 19th. There were only four days, the 10th, 11th, 17th, and 18th, on which no rain fell for the State as a whole. Nearly all creeks and small rivers were out of banks, resulting in perhaps the worst September floods with damage and loss of crops known in recent history.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---On the 6th, 13th, 20th, and 30th.

Frost, light.---On the 26th.

Frost, heavy in the northern tier of counties.---On the 26th.

Halos, lunar.---On the 18th.

Halos, solar.---3d, 5th, 7th, 13th, 25th, and 26th.

Thunderstorms.---1st, 2d, 3d, 4th, 5th, 8th, 9th, 11th, 12th, 14th, 15th, 16th, 19th, 20th, 24th, 25th, and 30th.

SPECIAL NOTES.

A thunderstorm, accompanied by high wind, occurred at and in the vicinity of Cameron, in the northwest part of Clinton County, Mo., at about 11:30 p. m., September 14th. The wind made a roaring noise, it came up suddenly and terminated suddenly. There was excessive rainfall after the wind. Trees were broken off, buildings damaged, and the light service was suspended. Total damage estimated to be about $5,000.

"Flood takes Million Dollar Toll."---"Not in the history of northwestern Missouri has it ever had a flood in September until this year. September rains have caused flood waters to sweep across the bottoms (Grand River), leaving devastation in its wake, and causing crop losses of more than a million dollars. Thousands of acres of fine corn, stalks carrying big ears, practically ready to be gathered, were wiped out in a few hours. Bridges were taken out and train service on the Wabash was at a standstill for a week. The September 1926 flood has exacted the greatest toll of all of the county's high waters. (Gallatin North Missourian.)

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for September, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., OCTOBER, 1926. No. 10.

GENERAL SUMMARY.

October, 1926, in Missouri, was generally a mild month, but much wetter than normal. It was slightly cooler than normal over the northern half of the State, the deficiencies being less than 1 degree. Over the southern half, outside of the southeastern lowlands, the temperature was nearly normal; in the southeastern lowlands the excess over the normal averaged about 1.4 degrees. The first general killing frost and freeze occurred on the 25th, except in a few protected localities; heavy frost, (heavy to killing,) occurred locally on the 24th. There was no damage as all staple crops had matured.

The more outstanding and adverse feature was heavy rainfall. The tendency toward frequent and heavy precipitation, so persistent during the latter part of August and most of September, continued through much of October, although the frequency was less marked in the southeastern quarter of the State during the first half of the month, and there was more or less letting up in the rain spells over the remainder of the State the latter half of the month.

With more rain and less sunshine than usual, most of the month was unfavorable for the farming interests. The wet weather caused corn to sprout and rot in much of the lower lands; stalks also were badly tangled in most sections and interfered with gathering and husking. Much corn was destroyed by overflows in the northwestern counties. Wheat seeding was delayed by wet ground, and considerable acreage was in poor condition for planting. The State highway work was much interrupted by the too frequent rainy spells.

TEMPERATURE.

The monthly mean temperature for the State, as shown by the records of 68 stations, was 57.3 degrees, or about normal. The southeastern lowlands were about 1.4 degrees warmer than normal; the northern half of the State was less than one degree colder than normal, and the southwestern plain and the Ozark Plateau were a little warmer than normal. Temperatures alternated above and below normal for periods of three or four days together, as a rule. About the coldest and longest period prevailed from about the 19th to the 26th, with the first general killing frost and freeze on the 24th and 25th. These two dates and the 31st, and probably locally on the 21st, were the only days with minima of 32 degrees or lower. The opening days of the month were the warmest, with maxima ranging from 85 to 93 degrees.

PRECIPITATION.

The average precipitation for the State, 101 stations reporting, was 4.67 inches. This amount is about 1.92 inches more than the 56 years' average, and about 0.18 inch less than last October. Not more than four Octobers during 50 years or more were wetter than the last two. All parts of the State were decidedly wetter than usual, but, all things considered, the rains were not quite so steady and so heavy in the southeastern lowlands as in the other sections during the first part of the month. Over all the State there was a break in the rainy spells on the 7th and 8th, and from the 14th to the 18th; and over the western half of the State there was less rain during the latter half of the month, which also would include much of the Ozark region. More than 8 inches occurred at one station, more than 7 inches at four stations, while from 4 to 6 inches were quite common as the monthly totals. The greatest amount in any 24 consecutive hours was 3.85 inches, at Eldon on the 9th.

MISCELLANEOUS PHENOMENA.

Earthquake.—Tremor felt at Poplar Bluff on the 27th.

Aurora.—At St. Joseph on the 13th.

Fogs.—2d, 10th, 11th, 13th, and 14th.

Frost.—Light to heavy 23d, and 24th. Killing.—Locally on the 24th, and more or less general on the 25th.

Hail.—Light at Clifton Hill on the 5th. Heavy few miles northwest of Amoret on the 19th; considerable damage, but no estimate obtainable.

Halos, solar.—3d, 12th, 14th, 17th, and 28th.

Halos, lunar.—On the 14th.

Thunderstorms.—1st, 2d, 3d, 4th, 5th, 9th, and 19th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem. R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for October, 1926.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., NOVEMBER, 1926. No. 11.

GENERAL SUMMARY.

There were a few pleasant days during November, 1926, in Missouri, but the month was mainly cold, the outstanding features being persistently low temperatures, excessive cloudiness, unusually heavy snows, and a few severe wind storms in the southern part of the State on the 25th. The snowfall was about four times more than the November normal amount, and for many of the central and east-central counties, probably the heaviest of record.

The month was mainly unfavorable for outdoor work in the eastern half of the State, but moderately favorable in the western. Much corn is still in the fields, especially the lower lands. The wheat crop, however, has started off well. The weather somewhat handicapped the highway work, but rather favored fuel and heavy clothing lines of business.

TEMPERATURE.

The monthly mean temperature for the State, 66 stations reporting, was 39.6 degrees. This value is nearly 5 degrees colder than the normal, about 3 degrees colder than last November and about 7 degrees colder than the same month in 1924. The temperature deficiency was about the same for all parts of the State, differing from north to south less than 1 degree. Only about two days in each decade were warmer than the normal. The warmest day was the 25th, when summerlike weather obtained, especially over the southern half. The coldest period probably prevailed from the 19th to the 22d; on the 21st, and 22d minimum temperatures ranged from near zero to 10 degrees or more above; and there were ten or more days with real winter cold, days on which the temperature did not rise above 32 degrees in any hour of the 24.

PRECIPITATION.

The average precipitation for the State, 100 stations reporting, was 2.98 inches, or about 0.63 inch more than the 56 years' average. The northwestern plateau was the driest section, while practically all of the remainder of the State was wetter than usual, the largest excess occurring in the southeastern lowlands. As a rule, the most persistent precipitation period covered the third week---13th to 21st. The first week, as well as the 10th, 11th, and 12th, and a few days during the last of the month, were mostly free from much precipitation.

The snowfall was the heaviest of record for most of the State, particularly the east-central sections; 16 inches occurred at Warrenton, and 10 to more than 13 inches at St. Louis, and Rolla, as compared with the past heavy fall of 13 inches. For the State as a whole, however, 5.0 inches fell in 1906, 4.3 inches this month. The average for November is less than one inch. It is likely that the snow of the 17th, and 20th-21st, broke previous 24 hour snow records at most central-east stations. There was no snow this month in the extreme Southeast, and it was hardly appreciable on the western border from Cass to Newton County.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---On the 22d, and 25th.

Halos, lunar.---13th, 16th, 21st, 23d, 24th, 28th, and 30th.

Halos, solar.---2d, 6th, 10th, 12th, 13th, 20th, 22d, 23d, 27th, and 30th.

Sleet.---8th, and 26th.

Thunderstorms.---8th, 12th, 13th, 14th, 17th, 25th, 26th, 28th, and 29th.

STORM NOTES.

Toward the close of a near summer like day, severe thunder and wind storms, some hail, and at least two tornadoes—associated features of a well developed low pressure—occurred over the southern half of Missouri on November 25th

Between 4 and 5 p. m. severe thunder with high wind and some hail began in the western part of Missouri from about Barry to Henry Counties, thence across the State to the Mississippi River, crossing into Illinois between 7 and 8 p. m. About 5 p. m. a tornado, with the usual funnel-shaped cloud formation, developed near and struck the village of Competition near the southern border of LaClede County. The storm advanced northeastward, passing over the village of Big Piney, Pulaski County, and the hamlet known as Vida, Phelps County, where, apparently, it arrived at 6;30 p. m., more, however, as a straight wind, so reported. The path was between 45 and 50 miles long. At Competition the path of marked destruction was from 100 to 150 yards wide; at Big Piney, one-fourth mile, and at Aida, about one-half mile wide. At Competition one person was killed, and one seriously injured; property, consisting of buildings, household effects, livestock, etc, damaged to the amount of $25,000; crops, $1,000. At Big Piney, no person was killed, but 10 seriously injured. The damage to buildings and tangible property was about $3,000; crops about $200. At Vida no one was killed or injured. Damage to buildings, household effects and livestock was estimated around $10,000; crops $200

A little later, at about 6:20 p. m., and approximately 100 miles farther south, a tornado struck the town of Brandsville, Howell County, from thence going northeastward it struck the villages of Rover and Thomasville, Oregon County, about seven and fourteen miles, respectively, from Brandsville. The storm traveled the distance from Brandsville to Thomasville in ten minutes. Beyond Thomasville all the way to Jackson, Cape Girardeau County, high winds were reported but no material damage. The storm's path was from one-fourth to one-half mile wide, narrowing down for short distances to one hundred yards. At Brandsville, three persons were killed and thirty-five injured (according to press reports one of the injured died a few days after the storm). The damage to buildings and tangible property was put at $75.000; crops $25,000; at Rover, none killed, five injured; property damaged, $8,800; crops, $5,000; at Thomasville, none killed, none injured; damage $5,000 and $100, respectively. At Jackson, Cape Girardeau County some out buildings, barns, etc. were blown down, damage about $300. Total lives lost in the two storms, five; injured fifty-three. Total damage to property, other than crops, $127,100; crops, $31,800. Hail was a conspicuous feature of the storms, but the stones were small, and caused no damage.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem. R. F. D No. 5. ‡ Indicates plus.

Daily Precipitation for November, 1926.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXX. COLUMBIA, MO., DECEMBER, 1926. No. 12.

GENERAL SUMMARY.

There were no spectacular features about the weather of December, 1926, in Missouri. It was just an ordinary winter month. It is true it was the coldest month of the year—colder than January—though only one-tenth of a degree colder.

There were a few real winter days, the most outstanding ones being the 14th, and 15th, for the State as a whole; and it was distinctly cold in the southeast part of the State on the 26th, when subzero temperatures were general, and at the same time the lowest of the month. There also were several fairly pleasant days and generally favorable for most outdoor pursuits.

Fortunately the month's precipitation was not much more than normal, as the ground was still rather full of water from the persistent rains of preceding months. This was especially true of the southeastern part of the State where field work has been much retarded. The snowfall was heavy over the eastern part of the Ozarks and most of the southeastern lowlands; but nearly everywhere outside of this section it was light, the amounts being inappreciable at many stations. A general sleet storm occurred over the northern part of the State on the 6th, and 7th. All outdoor objects were loaded with ice. The load was more than many trees, as well as telephone and telegraph poles, could carry, and actual damage to such property as well as loss from suspended wire communication was considerable. Ice covered ground and highways made travel unsafe for several days.

Most of the wheat was in fair condition, considering the late seeding. Most of the corn had been cribbed; and livestock entered the winter in good condition with plentiful feedstuff.

TEMPERATURE.

The monthly mean temperature for the State, 65 stations reporting, was 32.6°, 1.3° lower than normal, and about 1° milder than last December. There were no marked difference for any of the divisions, the southwestern plain being about normal, while elsewhere deficiencies from a little less than 1° to a little more than 1° occurred. There were no prolonged cold or mild spells. The most general cold days were the 14th and 15th, when about 28 stations recorded zero or lower. The 26th was an unusually cold day over the eastern part of the Ozarks and northern part of the southeastern lowlands, where temperatures dropped to 10° to 12° below zero. The 3d and 4th were the mildest days generally. The month's extremes were 75° above, and 12° below. There were about 25 days with minimum of 32° or lower.

PRECIPITATION.

The average precipitation for the State, 97 stations reporting, was 2.18 inches. This only about 0.15 inch more than the 56 years' average. The southeastern lowlands were wetter, while most of the Ozarks and southwestern plain got about the normal amount of moisture. The northern sections were moderately drier than normal. There were two general precipitation periods, prevailing from about the 5th to the 12th, and 19th, to the 28th; several days during the first, middle, and last part of the month were mostly free from precipitation, either rain or snow.

There was general sleet, (rain freezing as it fell or rain and sleet freezing in an ice layer) over the northern part of the State on the 6th, and 7th, and especially from the Grand River east to the Mississippi River. There was considerable damage to trees, and to telephone and telegraph poles, and besides travel was rendered precarious for several days.

For most of the State the snowfall was light, most stations recording inappreciable amounts. From the eastern part of the Ozarks to the Mississippi River the snowfall was greater than usual, totals ranging from 11 inches in Shannon County to 10 to 14 inches in St. Francois, Bollinger, and Cape Girardeau Counties. The greater part of the snow fell during one storm, on the 25th.

MISCELLANEOUS PHENOMENA.

Fogs, dense.---7th, 9th, 20th, 21st, 23d, 27th, and 28th.
Halos, lunar.---10th, 12th, 18th, and 19th.
Halos, solar.---3d, 20th, and 30th.
Sleet.---General over the northern half on the 6th and 7th; local in eastern and southern counties on the 8th, 9th, 19th, 27th, 28th, and 29th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for December, 1926.

GEORGE REEDER, Meteorologist.

Vol. XXX. Columbia, Mo., Year, 1926. No. 13.

GENERAL SUMMARY.

Except for some few relatively brief spells, the general weather of Missouri during the year 1926, was not conspicuous for any marked departures from the usual. There was little severe cold during the winter and the summer was practically free from prolonged intense heat. All of the principal elements, temperature, moisture, sunshine, and wind averaged up pretty well with their respective normals.

The few features worthy probably of more than passing note were the prevailing moderate and open conditions of January and February; heavy snow during the last days of March and first of April, and again in November; damaging local windstorms in the northwestern part of the State on June 16th, and in the southern part on November 25th, and the abnormally heavy rainfall of September.

The crop growing season had a few set backs, among which might be mentioned the late cold spring; lack of sufficient moisture in July and the first of August, particularly over the southern and eastern sections, and the persistently wet early autumn with its unprecedented floods from the northern streams and more especially the northwestern rivers. The last general killing frost occurred on the 19th of April, and the last real cold spell on the 15th of May. Owing to the general backward condition of vegetation there was little damage. Frost did some damage at some widely separated points on the 26th of September, but the first general freeze did not occur until the last week of October when all crops had matured.

Comparing each month with its normal, January, February, May, and August were warmer, and March, April, June, and November were colder, while the other months varied little either way. Generally, and for the State as a whole, the first seven months were drier than normal and this would include the first part of August; from about the middle of August to and including November there was an excess of rain. The total fall for August and September was more than the combined totals of the five preceding months. The combined totals of August, September, and October, was 20.09 inches, or about 47 per cent of the annual total.

Some localities suffered more and some less but in spite of the occasional adverse weather, Missouri crops were more than fair. Large and small fruits as well as nuts were unusually good, the late spring weather being favorable in keeping most of them back until all danger of killing frost was over. For instance, blackberries did not blossom generally until June, whereas they ordinarily are in full bloom the middle of May.

THE WEATHER BY MONTHS.

January.—Taking the month as a whole, the prevailing weather was relatively mild for mid-winter. There were only two real cold snaps, each being of less than a week's duration. The coldest of the two set in on or about the 20th, and by the 22d, zero to 10 degrees or more below had overspread nearly all sections, being unusually severe in the southeastern lowlands. A general reaction to milder followed on the 26th, the month terminating in spring-like weather. Precipitation was frequent, although not heavy. Snows were rather light in most of the northern half of the State, but heavy in the Ozarks and the northern part of the southeastern lowlands. Outside the usual daily chores, there was no farm activity, and outdoor work in general was practically at a standstill. Wheat came through the month in fair condition, Fruit buds in some localities were damaged by the cold.

February.—Unusually mild weather prevailed, with the exception of less than half a dozen days, and the temperature drop on those days was mainly unimportant. There were only 15 days with minimum temperatures of 32 or lower; and zero cold was brief, being limited to a few localities and confined to one day. The precipitation was about normal, and it was somewhat more frequent during the latter half of the month than the first part. The snowfall was very light for the State as a whole but there were some heavy local falls, particularly in Jackson, and Lafayette Counties in the west, and Saline, Linn, Randolph, Shelby, and Marion in the central and central-east parts. Some high winds occurred, the most outstanding gale being the one of the 18th, which was attended by drifting snow, and interfered with public traffic to some extent.

March.—This month was persistently cold, except a relatively mild period from the 15th to the 24th. The month was normally wet. Open weather prevailed the first five days but afterwards the wet spells alternated quite regularly with the fair ones, the former being somewhat longer. The general snowstorm of the 29-31st was the outstanding feature. This storm prevailed for nearly 48 hours. Over most of the State north of the Ozarks amounts ranged from 6 to over 14 inches; and there was a gale blowing, drifts of from 4 to more than 6 feet were common. The most extensive blockades of highways in recent years for the season occurred. There was no actual loss of property. Wheat was probably benefited. The apple and strawberry crops were not injured, but part of the peach crop suffered from low temperatures.

April.—A cold month in all sections of the State, and generally drier than usual. Real winter weather with snow during the opening days and killing frost occurred late in the month. The 17th and the 30th were about the only real spring-like days, that is, warm, pleasant days. All vegetation and farm operations were backward. Wheat made slow growth, and oat seeding was delayed. All fruits were kept back by the prevailing low temperatures and the condition was generally satisfactory. The commercial strawberry crop was fully two weeks latter than last year. There were a few damaging local wind storms on the 23d, and 27th.

May.—Changeable as to temperature and too dry. The first ten days approximated the usual but the remainder of the month was cold, and unfavorable for agricultural interests. There was frost on the 15th, but owing to the backward condition of vegetation there was little damage. Probably had the month been warmer, the lack of moisture would been more pronounced, although as it was, oats, grasses, strawberries, and early gardens suffered. Some timely rains, however, fell on the last three days. Much plowing was done. There were a few damaging hail storms.

June.—Mainly a cool month over all of the State, with some rather low temperature values on several dates. There were,, however, a few hot days with afternoon temperature ranging around the 100 degree mark. The monthly extremes, 37 degrees and 101 degrees, were within those of other years. The rainfall was about one inch less than normal, and drought effects were noticeable by the close of the month. Thunderstorms with hail were quite frequent, and locally both wind and hail resulted in damage, The weather was favorable most of the time for farming interests, with all work well up to the usual.

July.—There was a shortage of rainfall but otherwise the weather was fairly good for outdoor occupations. The first week was hot but the remainder of the month was pleasant to mainly warm. North of the Missouri moisture was sufficient for needs, but in the east-central and most of the southern half suffered from the lack of rain. Not more than one-fifth of the

(Continued on Page 54.)

Letters of alphabet indicate number of days missing from report: thus [a] one day; [b] two days, etc.

SUMMARY—*Continued from Page 50.*

stations for the State as a whole received amounts in excess of the normal, most of it falling during one rain. Corn on the heavier soils and on the bottom lands did well, but the upland crop south of the Missouri was badly fired. Wheat harvest made good progress.

AUGUST.—Warmer than normal with some real hot days during the first half. The general lack of rain during the last of June and most of July continued up to the 10th or 12th of August. All crops and especially the upland crops suffered, but general and copious rains the latter half of the month more than made up the deficiency, large excesses occurring at nearly all stations. The rains came too late to help most of the early planted crops but all late crops were benefited. Thunderstorms were of almost daily occurrence during the rainy spell but were in most cases free from hail and windstorms.

SEPTEMBER.—The outstanding features were the persistent rainfall over all the State, save the extreme southeast counties, and quite a nipping frost on the 26th. It was the wettest September during 50 years or more. With the soil already saturated by the August rains and most creeks and small rivers full, the September rains caused unprecedented floods for autumn. Coming at a time when the principal crops had matured, the damage and loss was heavy. Very little ground was prepared for winter wheat.

OCTOBER.—Generally mild but decidedly wet. The tendency toward frequent and heavy precipitation since the latter part of August continued during October. Only about two workable days occurred during the first ten days and four or five during the third week. The first killing frost and freeze, however, did not occur until the last week, finding all crops, except a few apple orchards, fully matured or cared for. The wet weather caused some corn to sprout and much was damaged on the lower lands by flooding. Wheat seeding was delayed by wet ground, and considerable acreage was poorly prepared for seeding. All outdoor work was much interrupted by the too frequent rains.

NOVEMBER.—Mainly a cold, cloudy month, with unusually heavy snows. Severe windstorms occurred in the southern part of the State on the 25th. The snowfall was about four times the normal, and for many of the central and east-central counties the heaviest of record. The month was generally unfavorable for outdoor work in the eastern half of the State, but moderately favorable in the western. Much corn was in the fields waiting more favorable husking and hauling conditions. The wheat crop started off quite well despite the unfavorable seeding season. The weather favored the fuel and clothing lines of business.

DECEMBER.—The prevailing weather approximated the usual December type. There were a few real winter days and several quite pleasant days. The month was wetter than normal. The snowfall was heavy over the southeast part but light in all other sections. A general sleet and glaze storm prevailed over the northern part on the 6th, and 7th. Farm conditions were about normal.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

MISSOURI SECTION.
GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., JANUARY, 1927. No. 1.

GENERAL SUMMARY.

The weather of the first month of 1927 showed considerable diversity, all of Missouri having mild almost spring-like conditions during the first ten days and the last four days of the month, while rather low temperatures and icy weather prevailed most of the time from about the 11th to the 27th. The widespread cold wave of the 14th, and 15th, brought subzero cold to most of the State; and excessive rains, augmented by severe sleet and glaze, resulted in heavy damage and much discomfort in the southeastern part of the State during a period of six or seven days starting on the 18th.

There was little or no activity on the farms. Winter wheat was in dormant condition but uninjured. The cold snap following the mild weather prevented premature fruit bud swelling.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 30.8°, or only about 0.4° higher than normal, the warm spells at the first and last of the month just about counterbalance the cold spell. The western half of the State, however, was warmer than the eastern half. During the first nine or ten days and last four days of the month the plus departures from the normal amounted to as much as 10° to 16°. The 15th was the coldest day of the month, when 27 stations recorded 10° or more below zero and six stations with 20° or more below zero, the minimum being —24° at Chillicothe. This is the lowest minimum since 1924.

PRECIPITATION.

The average precipitation for the State, 102 stations reporting, was 3.05 inches, or 1.02 inches more than the 56 years' average. There was no precipitation of importance during the first ten days. The precipitation was considerably less than normal in the northern but excessive in the Ozark Plateau and southeastern lowlands. Appreciable snow was general, except along the immediate southern border. Monthly totals of from 6 to 10 inches occurred in some central and northern counties.

EXCESSIVE RAINS, SLEET, AND GLAZE.

Excessive and nearly continuous rains occurred in the southeastern section of Missouri from about the 18th to the 24th. During this six or seven day period from 5 to more than 9 inches of water fell in each of the nine counties, Cape Girardeau, Scott, Bollinger, Stoddard, Mississippi, New Madrid, Butler, Dunklin, and Pemiscot. The flood conditions that followed were augmented by a severe sleet and glaze storm that prevailed from the night of the 21st to the 23d. It was the worst storm of its kind in that section for twenty years or more. All outdoor objects were heavily coated with ice, nearly an inch thick with attached icicles from 4 to 6 inches long. The utility companies suffered severely, the telegraph, telephone, and light services being demoralized for the time being. The water systems were also put out of order and fire did damage in some of the towns, Sikeston, alone, having a loss in excess of $7[illegible],000. The farming districts suffered much loss and damage by flood waters, besides many fine fruit orchards, commercial timber, and some small houses were badly damaged by the heavy loads of ice. The ice also was most destructive to fruit, ornamental and forest trees, westward over Ripley and Oregon Counties. According to the press estimates, the damage will run into many thousands of dollars.

The rather prolonged spell of inclement weather, with icy streets, and highways, and foggy mornings preceding the 24th, resulted in numerous automobile wrecks. especially in the central, east-central and northern parts of the State.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for January, 1927

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., FEBRUARY, 1927. No. 2.

GENERAL SUMMARY.

Unusual and persistent warmth for winter and something of scarcity of rain and snow were the outstanding features of February, 1927, in Missouri. Following a mild January in all of the State, about three weeks of the four comprising February were as warm and even warmer than the normal for March and the first ten days in April. It was the warmest February in about 40 years.

There was one moderate cold wave, but the month was free from the type of cold waves that are usually experienced at this time of the year. There was no zero weather during the current month, while in the past zero and subzero cold has been experienced in 35 of 39 Februarys, and some of these have given the coldest weather ever observed in Missouri. There was no damage from winds or other conditions.

The weather was mainly favorable for outdoor work and winter grains. It was, however, unfavorably warm for fruit, causing the trees to start out of their dormant state. Much plowing was done and oats and clover sown the latter part of the month.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 41.3°, or 9.5° higher than normal, and only about 3° lower than the normal for March. It is the greatest plus departure for any February of record, and is the fourth consecutive outstanding mild February. There was no severe cold at any time, and only seven days had temperatures below normal; there were about 20 days warmer than normal and on most of those days the warmth approximated the usual for the first ten days of April. The highest temperature was 78°, while the lowest was 1°, on the 8th and 18th respectively.

PRECIPITATION.

The monthly precipitation, based upon the reports of 103 stations, was 1.08 inches, or about one-half of the usual, as compared with the 56 years' average. The moisture, however, was well distributed and was ample for present needs. Fair weather and wet periods alternated regularly, the former being somewhat more pronounced. The greatest monthly total was 2.43 inches, at Campbell, and the least was 0.22 inch, at St. Charles.

SNOW, SLEET, GLAZE, AND WIND.

February usually is the month of heaviest snows. The present February was an exception, the snowfall for the State, as a whole, being light and irregular, averaging about 2.3 tnches. There were two snowstorms, the first coming along about the 9th, and was more or less general, and the other occurred at the close of the month but was confined to the western part of the State; in the southwestern part amounts were quite up to the usual, running to more than 6 inches in some localities, resulting in some temporary traffic discomfiture.

Sleet or glaze, probably both, occurred on the 9th at Dean, Neosho, and Seligman; on the 13th at Gorin, and Unionville; on the 17th at Kirksville, Lamonte, and Edgerton; on the 18th at Lebanon. Amoret, and Chillicothe, and at Seymour on the 1st, 9th, and 18th. There was no damage or loss reported. At Morehouse, on the 18th, there was a mixed storm of rain, sleet, and snow, with thunder and lightning and high wind. There was no damage.

Strong winds occurred on the 25th in Cape Girardeau, St. Francois, Wayne and adjacent counties. Apparently a straight flowing wind, reaching a gale at some points, but resulting in no material damage.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—On the 1st, 2d, 3d, 5th, 12th, 13th, and 14th.

Halos, lunar.—On the 9th, 11th, 12th, 14th, 15th, 19th, and 24th.

Halos, solar.—On the 3d, 5th, 6th, 7th, 11th, 14th, 15th, 19th, 21st, 24th, and 27th.

Thunderstorms (or thunder heard).—On the 4th, 6th, 15th, and 17th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXXI. Columbia, Mo., March, 1927. No. 3.

GENERAL SUMMARY.

March, 1927, in Missouri, was warmer than normal in nearly all counties, making the third consecutive month with like conditions prevailing. The month also was notable for excessive rainfall, frequent thunderstorms, and much hail. March frequently is quite generous with its snows, but during this month snow fell on but one day, the first; the remainder of the month, and especially after the 4th, was rather too warm for snow.

Some farm work was done the first two weeks, such as sowing oats and plowing, but the remainder of the month was far too wet for any kind of outdoor work. The rainfall was excessive, being about double the normal in all sections, except the northwest. The rain storm from the 17th to the 20th was particularly heavy, and damaging in central and southern localities.

Wheat, except where damaged on lower lands by high water, made fine growth and color. Early sown oats, as well as all grasses and fruits responded well to the warmth and moisture. The main highways were damaged in places by highwater, and the dirt roads were almost impassable. The wet weather rather adversely affected general business.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 68 stations, was 45.9°, 2.1° above normal and more than 6° warmer than last March. While all sections experienced weather warmer than the normal, the temperature excess was considerably less marked in the southeastern lowlands and most of the Ozark Plateau than in the western and northern parts. The first three days were the coldest, and the cold was general, the lowest temperatures, strange to say, occurring within a limited area in the Ozark region. Following the cold snap mild weather prevailed to the 19th and again the last three days. Summer-like weather prevailed from the 16th to the 19th.

PRECIPITATION.

The monthly precipitation, based upon the records of 103 stations, was 5.87 inches, and about 2.87 inches more than the 56 years' average. All parts of the State experienced excessive precipitation, and the clear periods were few, being limited to two or three days in each decade. Excessive amounts fell during a storm of the 17-20th, and again on the 31st, causing much damage by flooding bottom lands, traffic line washouts, and washing away top soil. The greatest monthly total was 11.24 inches, at Bolivar, and the greatest amount in 24 consecutive hours was 4.90 inches, at Amoret. General and heavy snow fell on the first; amounts ranged from 2 to 7 inches, the greatest depths being over the southwestern section.

HAIL, EXCESSIVE RAINS, AND FLOODS.

Hail, accompanying feature of thunderstorms and wind, occurred at Brunswick on the 5th, and 7th; Warrenton and Lexington, 7th; Lamonte, 10th and 31st; Louisiana, Conception, and Oregon 12th; Hollister, and Arcadia, 17th; Columbia, Lexington, Farmington, and Rolla, 18th; Bolivar, 20th, and Farmington, 23d; at this last named station the hail remained on the ground for three hours. The hailstones varied in size from peas to pecan nuts. The damage, owing to the season, was immaterial.

Severe thunderstorms, attended by wind and hail, advanced over the State from west to east during the the afternoon, evening and night of the 19th. The stones varred in size from playing marbles to walnuts with the hull on. There was little damage, except where mentioned further along. Hail fell first in the western part of the State at Appleton City, Amoret, Harrisonville, Lamonte, Centerview, Lexington, Oregon, Conception, and Bethany, and later at Columbia, Warrenton, and St. Louis. At Centerview hail fell six separate times during the 19th. At Lamonte, the "hail was uniform, round and solid ice and just the size of walnuts with the hull on. The ground was white with ice. Much damage was done to roofs and windows and very few houses escaped. Estimated damage about $3,000.

Koshkonong: Large hail stones fell on the 18th, breaking windows and damaging roofs. Damage about $200. Fruit was injured to some extent.

Bolivar: During a thunderstorm, with hail, on the 20th, 2.15 inches of rain fell in twenty-five minutes, causing Creek Branch which runs through the city to rise the highest within the memory of the oldest citizen. Houses were swept from their foundations. Estimated damage by flood $1,000. None by hail.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., APRIL, 1927. No. 4.

GENERAL SUMMARY.

This was the third month in succession to show, for Missouri as a whole, abnormal warmth, and the second consecutive month to show unusual wetness. It was the wettest April in 60 years, and only four in past years back to 1888 were warmer. The only real cool spell of the month prevailed from about the 20th to the 25th, with general frost and freeze on the 21st, and 22d, and locally on the 23d, resulting in severe damage to most tree fruits, and berries, and gardens, but not crops, in the Ozark region, but doing only slight damage in the other sections. In some of the Ozark valleys, trees had their lower foliage killed, the line of demarcation from green to black being a striking instance of the effect of air drainage; in some of the narrow valleys or so-called pockets, the temperature dropped as low as 18°, or about 10° to 12° lower than at higher elevations in the same neighborhood.

Thunderstorms were numerous and frequently attended by hail and wind, but after all, the outstanding feature of the month was its excessive and persistent rainfall, and resulting floods and vast damage and loss, thousands of acres of fine crop lands being submerged for relatively long periods. The floods were not brought about by the April rainfall, alone, but by the combined totals of the two months, March and April, which amounted to 14.33 inches, or more than twice the normal. More details are given further along; and storms are under a special heading.

With respect to preparing for and planting corn, farm work is the most backward in years, but the weather seemed rather to favor the wheat and oat crops, and of course all grasses. It was decidedly unfavorable for the State Highway workers; and the railroads had quite frequent delays by washouts. Farmers had to take to horseback and horse drawn vehicles to get to the main highways leading to cities and markets.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 69 stations, was 57.7°, 2.6° warmer than the the normal and nearly 8° warmer than last April. The warmth was quite uniformly distributed, although it was somewhat more noticeable in the Ozark region and the southwestern plain than elsewhere. Only one cool spell occurred, from about the 20th to 25th, and this one was widespread; frost and freezing temperatures were general on the 21st, and 22d, being more severe, however, in the Ozark region than elsewhere. There were eight stations north of the Missouri River where a minimum of 32° did not occur, while south of the river there were only four. Much damage was done to fruit in the Ozark region, orchards and strawberries being cut down fully 50 per cent; but almost no damage was done in the central and northern sections where it was not so cold or vegetation so advanced.

PRECIPITATION.

The monthly precipitation for the State, 103 stations reporting, was 8.46 inches, or 4.73 inches more than the 56 years' average. It was the wettest April since the beginning of rainfall records in 1867. The month was excessively wet in all sections but especially in the Ozark Plateau and the southeastern lowlands, where the monthly amounts averaged 10 to 12 inches. Four stations recorded more than four inches within 24 consecutive hours, but as a rule the 24-hour amounts were rather more moderate than is usual in times of continued rains; amounts for 48 hours beginning on the 13th were as much as 7 inches. In nearly all of the State there were but two or three days without rain from the 5th to the 21st, inclusive, and at most stations more than half the monthly total fell during that period. In the southeastern lowlands the rainfall since January 1st is more than double the normal, consequently that section has suffered severely from floods. The Missouri River below Kansas City, and the Mississippi River below St. Louis, as well as nearly all tributaries were out of banks a goodly part of the month, flooding thousands of acres of valuable lands, and resulting in vast damage and loss.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ††Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for April, 1927

WBO, St. Louis, 6-15-27—890

Continued from Page 13.

THUNDERSTORMS, HAIL, WIND, AND TORNADOES.

As an accompanying feature of more or less severe thunderstorms and wind, hail fell at Jackson on the 3d, 5th, and 14th; at St. Louis, Steffenville, Louisiana, and Hollister on the 4th; severe hail fell at Hollister on the 9th, damaging fruits and gardens; at Brunswick on the 10th, where the stones were one-half to 2 inches in diameter; very little damage owing to backward condition of field crops; hail also fell at Brunswick on the 12th, and 21st. At Fulton, Columbia, Clifton Hill, Warrenton, Edgerton, Lexington, and Oregon on the 10th; at Appleton City, Mexico, and Warrenton on the 12th; at Morehouse, 13th; Gorin, 18th; Columbia, Clifton Hill, Warrenton, St. Charles, St. Louis, Macon, and Louisiana, 19th; at Marble Hill, Poplar Bluff, Conception, and Tarkio on the 29th. A little sleet was recorded at Grant City on the 20th, and snow flurries at Jackson the 24th.

Northeast Missouri, from about Boone County to Adair and east to the Mississippi River, was visited by excessive rains, severe local hail, and high winds on the 19th. Between 10 a. m. and noon, excessive rain and heavy hail fell at Macon, Macon County, and at Monroe City, in the northeast corner of Monroe County. At Macon tracks were washed out, train schedules stopped, roads made impassable, and all creeks went out of banks. The storm traveled east-southeast, reaching Monroe City with heavy hail, the stones varying in size from a small walnut to small teacups. The path was about six miles wide, the severe part narrowing down to one-half mile or less. At Monroe City more than 3,000 window panes were broken, and many composition roofs punctured. Damage to buildings, etc., about $10,000; to crops and fruit $500. This section is not much of a fruit country, and most field crops were unplanted. The storm swept southeast over Ralls and Pike Counties, but, according to reports from those counties, the damage was immaterial.

Squalls were more or less general before noon in Boone and Callaway Counties; and about 11:30 a. m. a small tornado apparently formed in the southeast part of Boone County, in the neighborhood of the Little Bonne Femme Creek, and traveled northeast passing over the northwest corner of Callaway County. The tornado did not sweep the ground all the way, although tree tops were twisted off most of the way; three homes and five barns were wrecked, at a loss of about $15,000; no persons killed and none injured. The storm passed over Benton, Audrain County, about 36 miles from the starting place at 12:30 p. m., as a straight blowing wind, doing some $200 damage to buildings, etc,. and reached Vandalia in the northeast corner of Audrain County, 20 miles from Benton, at about 1 p. m. It struck Vandalia with considerable violence, demolishing or damaging 25 to 30 buildings, lifting and throwing aside two loaded freight cars, but, strange to say, only injuring four persons, none seriously. Damage put at about $40,000 or $50,000. Soon after passing over Vandalia the tornado lifted from the ground and traveled over Pike County, straight northeast to Louisiana as a strong gale. but, according to reports received, doing no material damage.

About 1 p. m. another tornado developed in Lincoln County, in the neighborhood of Sandy Creek, four and one-half miles southwest of Apex. This could not have been the same storm that struck Vandalia about the same hour, 40 miles northwest, but it sprung from the same strong wind that embraced most of the east-central counties from 10 a. m. to 1 p. m. The tornado passed over Apex, or a little to the north, injuring twelve persons, five seriously, with one not expected to live. The damage to houses and household effects, etc., was estimated to be between $15,000 and $20,000. Orchards to the extent of $1,000. The tornado lifted and passed over the Mississippi River, into Illinois where, according to the section director for Illinois, it was very destructive.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., MAY, 1927. No. 5.

GENERAL SUMMARY.

A month to be remembered by the frequent and excessive rains and consequent large percentage of cloudy weather, the severe river floods, the continuity and destructiveness of winds and hail, and consequent loss in property as well as lives, entailed upon the State. Such, in brief, were the outstanding features of May, 1927, in Missouri.

Notwithstanding the fact the month averaged normal as to warmth, the mean temperature being 64.6°, exactly agreeing with the 36 years' normal, the general public has put the month in the cold class, largely because of the lack of sunshine, and the prevalent dampness, such conditions requiring rather frequent house warmings. There was only one real cool spell of about a week duration beginning on the 10th, with light frost in central and northern sections on the 11th, and 12th. Light frost in May, however, is not unusual. As to the general distribution, the northern part of the State averaged slightly cooler than the normal while the southern half was a little warmer.

Apart from some of the northwestern counties, the rainfall was excessive everywhere, being most pronounced in the southeastern lowlands, where it was from twice to three times the usual, and augumenting the already very disastrous flooded conditions that have prevailed in that section since about the tenth of April. In most of the State creeks and small rivers were in flood, inundating bottom lands, destroying valuable crops and other property, while the principal rivers were bankfull, causing much uneasiness and interest in the daily stages.

It was a hard month on the farmers, and the weather adversely affected nearly every kind of outdoor occupation. At the close of the month not more than 60 per cent of the corn had been planted, while many sections had hardly started. There was too much water for best results in both wheat and oats, while fruits, truck, and gardens made indifferent advances, but pastures and all grasses made excellent growth. The planting season is the most backward in many years.

Severe wind and hail storms are treated under special headings.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 64.6°, or practically normal. The northern half of the State experienced a small deficiency, while in the southern half there was a slight excess. The largest departure from the normal was −1.2°, in the northeast plains. The temperature alternated above and below the normal for short periods, the longest and coldest period running from about the 10th to the 16th, the coldest days being the 11th and 12th, with minima from about 38° in the southeast to 34° in the central and northwest sections, with light frost more or less general north of the Missouri River, but without any damage. The warmest period was from the 17th to the 24th, the 23d being the warmest day, when afternoon temperatures ranged around 90°, although the 17th, 18th, 24th, 26th, and 29th were nearly as warm. The maximum was 94°, the lowest since 1919, and the minimum was 34°, the highest since 1922.

PRECIPITATION.

The average precipitation for the State, 101 stations reporting, was 6.98 inches, or about 2.28 inches more than the 56 years' average, and the wettest May since 1915. Only six other Mays have been wetter since the beginning of rainfall records in 1867, although several other Mays have been nearly as wet as this one. And besides the rainfall of the present month was not evenly distributed, the southeastern lowlands, for instance, receiving about three times the normal, while the northwestern plateau got about half the usual May rainfall. The frequency of the showers and the heavy daily amounts were the outstanding feature. All sections reported heavy to excessive twenty four-hour amounts, the largest being 4.62 inches, at Caplinger Mills on the 31st, in fact this water fell within about one hour and forty five minutes, according to the observer there. The 1st, and 2d, the 11th, and 12th, the 15th,

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for May, 1927

[a], [b], [c], etc., indicate respectively 1, 2, 3, etc., days missing from the record. §§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

WBO, St. Louis, 6-30-27—890.

Continued from Page 18.

and 16th, and the 26th were about all of the fairly outdoor workable days. The heaviest local monthly amount was 13.62 inches, as compared with 16.10 inches and 15.98 inches, respectively, for the same month in 1896 and 1915.

MISCELLANEOUS PHENOMENA.

Earthquakes.—Slight tremor at about 2.30 a. m. at Poplar Bluff, and Campbell.

Frost, light.—Locally on the 11th, general in central and northwest on the 12th.

Hail.—Conception and Seymour 1st; Campbell and Cairo 5th; Springfield 6th; St. Louis, Marshall, and Kansas City 7th; Downing, Fulton, Aurora, and Springfield 8th; St. Louis, Eldon. Farmington, Hollister, and Seymour 9th; Morehouse and Arcadia 10th; Clifton Hill, Macon, Sikeston, Greenville, Columbia, and Kansas City 13th; St. Louis, Marshall, and Conception 18th; Fulton and Hollister 19th; Centerview 22d; Brunswick, Clifton Hill, and Louisiana 23d; Clifton Hill 27th; Fulton, St. Louis, and Lebanon, 28th; Caruthersville, Morehouse. Parma, Arcadia, Gano, Greenville, Lebanon, and Hannibal 30th; Olden and Lamonte 31st.

Thunderstorms, the resulting feature of low pressure areas, were more or less general on 22 days.

DAMAGING HAIL AND WINDSTORMS.

13th.—A hail storm of considerable severity passed across Scott County in the vicinity of Commerce. The path was about 10 miles long and 3 miles wide, on the average. Stones ranged in size from a hickory nut to hen eggs. Truck, peach and apple orchards were damaged to the amount of $5,000. Light hail fell at Sikeston, and at Charleston later in the day.

28th.—Severe hail fell in St. Louis. The stones were large, one measuring two and three-fourths inches in diameter. Extensive damage resulted, especially to windows, greenhouses, and automobile tops. According to the press, the storm lasted about twelve minutes, but the damage was severe, Shaw's Garden alone suffering damage of about $750,000.

30th.—Hail fell at many points on this date, and especially was it widely distributed in the southeast quarter of the State. During the early night (30th) a severe wind and hail storm swept Scott County, having Sikeston more or less as a center. The wind and hail caused about $70,000 damage in the town. In the country the damaged area was 10 miles long by five miles wide, and the damage to corn, cotton, and other crops has been estimated as high as $400,000. The storm occurred about 7.30 p. m.

About the same time, 7.40 to 7.56 p. m. (30th) a damaging hail storm occurred in Marion County. "The storm approached with a rather loud roar and hail fell at Hannibal. The storm was damaging to orchards and gardens from about Wither's Mills P. O. to Fette's orchards which are on the northern limits of the city, a path about 5 miles long by 1-2 mile wide. The stones varied from 1-2 inch to 1 inch in size; the damage was estimated to be $2,500 to $3,000." (O. I. C. Hannibal.)

A severe and tornado-like wind occurred at Centerview, Johnson County on the 9th, with clouds of dust, but doing only a small amount of damage. On the 10th, a severe wind, something like a tornado, swept over Morehouse and vicinity, New Madrid County. Small houses and some barns were wrecked, and other damage done, to the amount of $10,000.

As a part of the general storm of the 8th, a damaging local wind, with hail, occurred in Douglas County, at 10 p. m. The storm, probably a tornado, travelled from southwest toward northeast, passing a little west and north of Ava. The path was one-fourth to one-half mile wide, and about 20 miles long. Five buildings were completely destroyed and four others damaged. Two men, Twin Turner and Jason Rowe, were killed, and thirty other persons injured. The amount of damage sustained was put at $9,000 by the wind, and about $200 by hail to crops.

TORNADOES IN MISSOURI DURING MAY, 1927.

Violent local storms, in unusual numbers, occurred during May, 1927, in Missouri. Tornadoes, at least five, causing loss of life or doing heavy damage to property, were reported on the 8th, 9th, 18th, 24th and 27th. The tornadoes of the 8th, and the 9th, were unusually severe, and especially the one of the 9th, known now as "The Poplar Bluff Tornado," which, for amount of destruction of life and property, has no equal in the annals of Missouri Climatology.

Tornado of May 8: Originated or began in Missouri in the neighborhood of Macks Creek, southwestern part of Camden County. Travelled northeast to Audrain County near the northwest corner of Montgomery County, where it dissipated or left the ground. Nearly a straight line path of about 110 miles, and from 200 to 400 yards wide. It followed the ground most of the way but lifted here and there, and especially as it crossed Cole County, where only small damage was done. It passed near Eldon, Miller County, at 8.40 p. m., having left Macks Creek at 8 p. m. In Camden County it travelled through a rather sparsely settled country, but hurt three persons, and swept over six homes and as many barns, doing damage to the amount of $8,000, and destroying fruit to the amount of $3,000. In Miller County four persons were killed, 30 injured, and property consisting of buildings, household effects, livestock, etc., were damaged to about $120,000 worth. This seems to be quite a favorite ground for tornadoes. During forty seven years four tornadoes have crossed Miller County from southwest toward northeast and all within a path of seven or eight miles wide within the neighborhood of Eldon. The first on the record was on April 18, 1880; the second on May 19, 1896; the third on April 19, 1916, and the fourth on May 8, 1927. And it might be of some importance to note that the days of occurrence are well grouped.

The tornado crossed the Missouri River into Boone County a short distance south of Claysville, and from thence it made a beeline northeast over Callaway County to Audrain County. From where it touched Boone County to where it left the ground, the path was followed and inspected by the writer. From the Missouri River onward about five miles the damage was confined to tree tops, which in most instances were twisted off and split open. Just about four miles west of Bloomfields, Callaway County, it fairly hugged and swept the ground with terrible force, and from there on for about thirty miles it made a clean cut path averaging about 300 yards wide, killing six persons, hurting badly 17, and destroying property to the value of around $168,000. Hail fell at several points along the path but the stones were small.

Ruben Phillips, a well-to-do farmer, lived in a well-built one and a half story house, just in the middle of the storm's path, west of New Bloomfields. His house was set on solid concrete foundation, the house being bolted with half inch iron bolts to the concrete. Strange to say this seemingly secure way of preventing his house from blowing away, was the cause or one of the causes of the owner's death, his daughter, and a visiting girl. The family, father, mother, son, and daughter, and a visiting girl had just returned from church, getting home about 9.30 p. m. From what the writer could gather from the son, about 15 years old, soon after getting inside the house the father, daughter, and young girl friend, started for the basement. The house was struck with terrible force. It was lifted apparently, snapping the iron bolts like match sticks, twisted out of shape, thrown down on the ground to the east side, making a great trench, and then thrown back partly upon its own foundation. From the apparent resistance of the iron bolts to the fury of the wind, the western side of the concrete foundation, 16 feet long, 6 feet high, and 4 inches wide or thick, was torn loose, thrown across the middle of the basement and broken into three or four pieces. One of these great slabs of concrete apparently killed the father and daughter just as they reached the bottom of the basement stairs. Had the house not been bolted to the concrete, it probably would have been lifted fairly clean from the foundation and blown away, leaving some relatively safe places in the basement. A large barn about 100 feet to the southwest of the dwelling, was blown clean away, not a plank left; and other small houses in the path were blown from their foundations and smashed a distance away. It seems also probable that the barn might have been picked up and hurled against the dwelling, the combined forces being too much for the iron bolts to hold. The mother and son, the only two survivors, as well as nearby neighbors, stated that the whole affair was over and done within thirty to forty seconds. Large trees were torn off halfway down, or uprooted and carried several hundred feet. A tornado on April 18, 1880, the same that struck Eldon, Miller County, traveled this same path or paralleled it within 100 feet or more.

No further data or news was gathered of the tornado after it left the ground in Audrain County. But that same night about 1.40 a. m. to 2.10 a. m. (May 9th) a 75-mile gale passed over St. Louis, causing, according to the press, widespread damage in and near St. Louis. One person was killed. There was heavy damage to industrial plants, estimated to run up and over $1,000,000.

THE POPLAR BLUFF TORNADO, MAY 9:

From all available reports, and the territory has been covered most carefully, this tornado had its origin somewhere in the neighborhood of the southwest border of Randolph County, Ark., at 2.30 p. m. From thence it traveled speedily northeast, striking, killing, and destroying, at Maynard, Ark. From thence deadahead for the Missouri border, crossing into Ripley County, where Current River crosses the border into Arkansas, and at or near the little hamlet known as Currentview, at 3 p. m. Here it claimed its first human life in Missouri, killing a boy named Fred Daub, and badly hurting four. From thence it traveled a rather rugged, timber covered territory, tearing up large trees, and stripping the bark from others, straight away it whirled, cutting a path from one-half to one-fourth mile wide, with the settlements of Acron, Glenn, Torch, Naylor, Parks, Taft, and Harviell on the righthand, and Oxly and Fairdealing on the lefthand, destroying homes, barns, schoolhouses, churches, and orchards. When about 10 or 12 miles southwest of Poplar Bluff and one or two miles northwest of Taft, the storm, for the second time in Missouri, destroyed human life, killing a family of three, named Grosshart, and a few miles further on where it crossed the highway it caught a tourist car, killing all, six persons. This was about 3.06 or 3.08 p. m.

It is about 28 miles from the point where the tornado came into Missouri to Poplar Bluff. It crossed the border about 3 p.m. It was on and tearing up Poplar Bluff fifteen minutes later, having rushed northeastward at the rate of 112 miles an hour. And with all the fury it had gained in its mad rush, the tornado hit the prosperous little city, and county seat of Butler County, and in less than three minutes there was scarcely anything but death and destruction left in its wake. The fateful two or three minutes, possibly less, was definitely fixed at 3.16 p. m. by a little clock that hung against the wall at the East Side Grammar School. It stopped exactly at that time when some flying object struck it. The storm swept through the business section of the town, completely demolishing and destroying beyond all usefulness every building in 35 business blocks save four, the post office, the high school building, the Missouri Pacific station, and the Bank of Poplar Bluff, and even these suffered much damage.

The following vivid word picture of this terrible storm is by Mr. Turner Catledge, newspaper correspondent at Poplar Bluff:

> Sixty people lying dead, this commercial jewel of Southeast Missouri torn down almost to the level of its own ground, with property damage estsmated anywhere from $5,000,000 to $10,000,000, Poplar Bluff to-day looked up from the wreckage of the worst tornado disaster recorded in the annals of this part of the country***.
>
> The town was torn to pieces just like a person would take a piece of tissue and snatch it into a thousand pieces.*** Buildings collapsed like egg shells and how anyone in the business district escaped is one of those miracles that accompanies such disasters. Rain, torrential rain, lightning, frightful lightning, followed the crash. Witnesses told how fire seemed to shoot from the leaden skies, hit the pavement and spatter like a huge rocket.****
>
> The cyclone (tornado) came with midnight blackness in less time than it takes to tell it. A brownish, yellowish, smoky glow appeared in the west. The whole universe seemed boiling. Every one looked for rain. Instead it rained hail like brimstone which added horror and awe to the roar. People knew something was in the air. Frantic they ran in all directions. In an instant it was upon them and three minutes lengthened into three hours. Pandemonium reigned. Brick, stone, concrete, steel, wood, automobiles, and even people went hurtling through the air. Many ran about the streets screaming and yelling, while others looked up to see what havoc the visitation had wrought. The elements were still boiling, but in a second, rain, torrential rain, began to fall and for three hours sheets of water came down to add its horror and waste to the stricken city.

The storm seemed to have spent its force and fury at Poplar Bluff, although strong winds were felt northeast and east as far as Cape Girardeau County, but there was no material damage done outside of Butler County.

The latest compiled list of the dead, in the city limits, gives 74 names; and the list of injured carries about 300 names, some dying later have been added to list of dead. The property damage, excluding crops of all kinds, has been estimated all the way from $2,100,000 to $10,000,000. According to a survey made by the American Red Cross, completed May 19, 1927, 325 families, outside of the business district of Poplar Bluff, were affected either through death or injury to members of their families, or through property loss, in this tornado.

Both of these tornados traveled some hilly country. But nothing that nature or man built seem to swerve either from their selected path. They swept the ground up hill and down hill, across valleys, and rivers with equal ease and persistence. And both were occasionally attended by hail. Crop damage was immaterial because of delayed planting.

May 18: A tornado traveled northeast across a part of Randolph County, east of Moberly, from 8 .p m. to 9 p. m. It started about Renick and disappeared before reaching Evansville. The track was ten miles long, and from 200 to 1000 feet wide. No person was killed or injured. Two dwellings were blown from their foundations, and three barns were quite badly wrecked. Damage about $7,000.

May 24: A tornado advanced in easterly direction through St. Joseph, Buchanan County, from Kansas, beginning about 5.18 a. m. "Its destructive path was approximately two blocks wide, but not continuous, the greater part of the destruction being in a business portion of the city. The course of the tornado was to the southeastward with considerable damage for several blocks in the residential district beginning at Sixteenth and Olive streets. Then after another interval of about a mile with only light damage, the tornado blew down many valuable trees in Bartlett Park, after which it lost energy, but high winds in a path of one-half mile continued for a time to cause damage to trees, chimneys, etc. Two persons were slightly injured and none killed. As a conservative estimate, made by the city engineer, the damage done amounted to about $200,000." (O. I. C., St. Joseph.)

May 27: During more or less general thunderstorms, with northwest gales, a tornado, for the second time during the month, formed in the general gales in Randolph County, a little north of Roanoke at 5 p. m., thence eastward in a path about one-fourth mile wide and nearly ten miles long, passing through Yates and lifting from the earth just before reaching Higbee. It was more or less destructive all along its path, wrecking dwellings, barns, and killing stock, besides killing five persons and injuring eight. The amount of damage is estimated to be around $100,000. Crop damage not estimated as the main crop, corn, was not planted.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., JUNE, 1927. No. 6.

GENERAL SUMMARY.

June opened as May closed---with prevalent cool weather and general showers and thunderstorms. To be correctly described, the weather of June, 1927, in Missouri, must be divided into two classes, one rather abnormal and decidedly unfavorable and the other nearly ideal and highly favorable. The first 20 to 22 days belong to the first class, while the remainder of the month falls in the other. The persistent rains that have prevailed since the middle of March continued up to about the 22d when they came to an abrupt end, and from then on the weather was clear, and relatively warm and favorable for all outdoor occupations.

In spite of the few hot days near the end of the month, the outstanding feature was the persistent subnormal temperature. While this month averaged a little cooler than June, 1926, that month had more warm days and more sunshine, while the current month was notable for much cloudiness. While the ordinary thunderstorms were numerous there were no real violent storms of any kind.

Owing to the wet and unfavorable season nearly all farming interests were two to three weeks behind the average at the close of the month, although field work made considerable advance during the last eight or ten days. Small grains were only fairly promising; and much corn was just coming up. Fruits of all kinds were indifferent as to quantity and quality, having been adversely affected by April frost, and by heavy rains at the time of pollination. The State Highway work was much handicapped by the rains.

TEMPERATURE.

The monthly mean temperature for the State, as shown by the reports of 65 stations, was 70.3°, or about 3.2° cooler than the normal. Besides closely agreeing with the mean of the same month last year, it is the third real cool June in about forty years. All sections experienced a marked deficiency in temperature, the northeast with a negative departure of 4°, stands rather apart from the others. There was a general cool spell from the 12th to the 19th, while for brief periods from the 8th to the 11th and again the last two days were the only generally warm periods. The extremes were well within the limits of other years, the maximum being 99° and the minimum 41°. Afternoon maxima of 90° or higher occurred on an average of four days.

PRECIPITATION.

The average precipitation for the State, 100 stations reporting, was 5.77 inches, or about 1.10 inches more than the 56 years' average. All parts of the State received more than the normal amount, the greatest falling over the Ozark Plateau where the excess averaged 1.92 inches. Some unusually heavy monthly amounts occurred, the largest being 11.61 inches at Lebanon, while Benton and Osceola each received over ten inches. The heaviest 24 hour amount was, for the second consecutive month, recorded at Caplinger Mills, where 5.23 inches fell, causing the local rivers to go out of banks. Practically all of the monthly rainfall occurred during the first three weeks, the last ten days being nearly rainless. This June was 2.15 inches wetter than last June, but not as wet as the same month in 1925.

SPECIAL STORM NOTES.

June 3.---A thunderstorm with strong wind and some small hail, swept over Boone and Callaway Counties between 5 and 6 a. m. Damage was confined to trees and some small outhouses, telephone and telegraph wires. Henry Kite of Boone County, and Jesse Burton of Callaway County, were killed by lightning.

Severe thunderstorm, accompanied by strong wind, and local hail, crossed the State from west to east, starting in Linn County and ended in Marion, between 12 m. and 1:30 p. m. (June 3). Excessive rain fell at Brookfield, Linn County, while at Macon, Macon County, the wind was severe and hail heavy. To some persons the storm looked like a tornado but high in the air. Buildings and trees were damaged by the wind, and the hail destroyed some corn and garden truck. Estimated loss not obtainable. According to the Weather Bureau Official at Hannibal, the storm struck there at 1:19 p. m., and that it was the most severe wind and hail storm that has occurred in that vicinity in many years. The stones averaged one-half inch or more in diameter. The hail covered a long but rather narrow path, the effects being noticeable for a number of miles in a northwest direction, particularly a little north of Withers Mill and in a southeasterly direction into Illinois near Kinderhook. The damage was estimated at $100,000, but it was thought to be somewhat excessive, although the damage by hail to crops apparently was not taken into consideration. The Telephone Company and the City Electric Light service lost many poles and much wire and cable. There was no damage reported from Shelby County, but small hail fell locally, and also in the southern part of Lewis County.

June 19.---A severe wind and rain storm swept over Joplin, Mo., early in the morning, wrecking two homes, injuring two persons, unroofing and otherwise damaging numerous other buildings, uprooted or broke off several hundred trees and blew down more than 50 power line and telephone poles. Rain fell in torrents. Estimated damage about $10,000.

Besides the foregoing, small hail fell at Kansas City, St. Joseph, Lexington, and Steffenville on the 3d; Hannibal, Clifton Hill and Steffenville 11th; Springfield and Lockwood 19th.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson; of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for June, 1927

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., JULY, 1927. No. 7.

GENERAL SUMMARY.

July, 1927, in Missouri, averaged cooler than the normal, while the rainfall, sunshine, and winds were about normal. Sunshine and showers followed in quite a regular and pleasing fashion, and with mostly gentle to fresh winds, the weather during most the time was about ideal for midsummer, that is, in the open outside of the cities. There was some local damage by wind and hail, and some of the small rivers of the Ozarks were out of banks, but the month was comparatively free from serious and damaging storms, such as have prevailed during the four months preceding. (See under Special Storm Notes for hail and wind damage.)

July was the most favorable month since the beginning of the season for crop growth. The unusually backward condition of the corn crop has been largely overcome, although the bulk of corn is still behind the seasonal average condition. Wheat, oats, and a remarkably fine crop of hay were harvested under especially favorable weather. At the close of the month moisture conditions were unusually favorable for the season of the year, as no single locality was suffering from the lack of rain. Plowing for fall seeding was well advanced and much ahead of the same work last year.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 75.8°, or 1.6° below the normal, and the coolest July since 1924. While subnormal temperatures were general, the deficiency was less marked in the southeastern lowlands, averaging less than 1°, and more noticeable in the Ozark Plateau, where the daily average exceeded 2°. The highest temperature was 101°, at Sikeston on the 10th; the normal is 106°. The lowest was 48°, at Goodland on the 4th and Arcadia on the 9th; the normal is 46°. The average number of days with maximum temperature of 90° or higher was 11, and about 6 less than usual; 100° or higher was reached at only two stations on two days.

PRECIPITATION.

The average precipitation for the State, 105 stations reporting, was 4.13 inches, or 0.08 inch more than the 56 years' average. In the northern half there was a deficiency, ranging from 0.97 inch in the eastern part to 1.61 inches in the northwestern section; south of the Missouri River there was a general excess, ranging from 0.56 inch to 1.70 inches. As a rule the rains were gentle, falling at regular intervals at about four to seven days, and were highly beneficial. There were a few excessive falls, the heaviest monthly being 10.95 inches, at Aurora, while the greatest amount in any 24 consecutive hours was 4.65 inches, at Lockwood on the 20th.

SPECIAL STORM NOTES.

July 6.---A severe hailstorm occurred in Nodaway County in the vicinity of Burlington Junction at about 5 p. m. Stones were large and damaging. The path, fortunately, was narrow and not over a mile or two long, though small hail covered considerable territory. Automobile tops were pierced. Corn, gardens, hay, and fruit were damaged to the extent of $5,000. That same night, a severe thunder and wind storm caused about $16,000 damage in the city of St. Louis.

July 13.---A hail and windstorm of much violence in the late afternoon, laid waste to thousands of dollars worth of crops in the southern part of Gentry County, in the neighborhood of King City. The damage area was about four miles wide by six long. Some of the stones were as large as hen eggs. The loss is put at $30,000.

July 24.---Severe hail, the second storm of the summer, accompanied by high wind and excessive local rain, swept over Nodaway County between 5 and 6 p. m. To the west and northwest of Maryville, the hail was the worst in many years, according to our Special Observer, Mr. J. R. Brink, and the Press of that County. Besides fruit and gardens, 10,000 acres of fine and well advanced corn were damaged, about 2,000 acres being a total loss, the damaged area extending from Clearmont southward through Burlington Junction and Wilcox townships. The stones were unusually large, and ice remained packed away in shady places for many days. The loss to that farming section, as a conservative estimate, will exceed $70,000. Later press reports said that a Mr. Arch Jones, proprietor of the Merchants Cafe, Burlington Junction, has kept some of the stones of the storm of July 6 in his Frigidaire. The largest stone on the day of falling weighed eight ounces and measured 11 inches around the largest part, these chunks of ice being not completely round but flattened out somewhat. On August 10th, the stone was again weighed and measured, and was still 11 inches around but had lost one ounce in weight.

July 28.---A tornado formed in Johnson County, Kans., in the neighborhood of Monrovia, at about 4:45 p. m. It crossed into Missouri and through a part of Kansas City. There were no casualties of a personal nature, according to the O. I. C., Weather Bureau, Kansas City, and the property damage was confined to 4 small houses wrecked, and 16 others more or less damaged. Estimated damage $25,000.

Lightning Casualties.---Two men, Kenneth Ellsberry and Verall Acell, were killed by lightning in Shelby County, on the 18th. Two women, mother and daughter, a Mrs. Gamble, were fatally injured by lightning in a cotton field in Butler County, on the 20th.

MISCELLANEOUS PHENOMENA.

Aurora.—On the 21st, at Downing, Hannibal, and St. Joseph.
Halos, lunar.—10th. Solar.—1st, 6th, 10th, 11th, 14th, 18th, 28th, and 29th.
Hail.—6th, 12th, 17th, 19th, 24th, and 31st.
Thunderstorms.—1st, 5th, 6th, 7th, 9th, 11th, to 17th; 19th to 31st.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus,

Daily Precipitation for July, 1927

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., AUGUST, 1927. No. 8.

GENERAL SUMMARY.

August, 1927, was distinctly a cool month for summer, and it made the third consecutive month experiencing subnormal warmth in all Missouri. The mean temperature was 71°, nearly 5° cooler than it normally is during August and only about 2° warmer than a normal September, whereas August usually is 7° warmer than September. This August also was the sixth consecutive month wetter than normal.

The subnormal average temperatures for August resulted from persistently cool days rather than unusually low minima. In fact, lower minima have occurred in other years, and one month, August, 1915, even averaged cooler than the current month. However, it was the second August in the past 40 years in which the value 100° was not recorded in some part of the State, the maximum 97° being the lowest of record. In spite of the frequent rains during the first three weeks, the average total number of sunshine hours was 282. This is about 66 per cent of the possible and only about 5 per cent less than the normal, yet, the Sun apparently failed to play up to his usual fiercest chromatic scale.

The month was practically free from damaging storms and destructive winds, and there was not a single report of hail anywhere in the State. A few severe local thunderstorms occurred but there was no damage reported. One Ed. Hollaway of Boone County was killed by lightning the afternoon of the thirteenth. Corn made slow advance until the last week when more favorable weather set in. More than half was earing and and on up to the dough and denting stage. About one-fifth of the crop probably will not mature being too backward.

TEMPERATURE.

The monthly mean temperature for the State, 68 stations reporting, was 71.1°, or 4.9° below the normal, and only about 2° warmer than a normal September. Except in 1915, no other August since the beginning of temperature records in 1888 has been as cool. There was a remarkable sameness about the temperature distribution, as, when the values are expressed to whole numbers, the average deficiency was 5° in all sections. Temperatures were 90° or higher on an average of only four days, the maximum being 97°, which is the lowest of record, and is the second time in 40 years that the value 100° was not recorded at one or more stations in August. The lowest temperature was 39°, recorded at Goodland, in the eastern Ozark hills, on the 28th, but lower minima have been recorded in past years although not often.

PRECIPITATION.

The average precipitation for the State, 104 stations reporting, was 5.06 inches or 1.38 inches more than the 56 years' average, and 0.57 inch less than the same month one year ago. All sections, except the southeastern lowlands which had a small deficiency, received an excess of precipitation. Excessive amounts occurred in the southwestern counties where eight to thirteen inches and more were general. The heaviest monthly total was 13.87 inches at Lamar; and the heaviest 24-hour fall was 7.76 inches at Caplinger Mills. This latter amount has been exceeded only three times in August in the last 40 years. All local streams went out of banks resulting in the usual destruction of crops and other property. Rain fell on an average of 9 days, compared to the normal of 7 days. Only scattered showers occurred after the 23d.

Excessive rain on the 8th, and for a second time, from the 14th to the 16th, caused the small rivers and creeks in the southwest part of the State to overflow, inundating thousands of acres of bottom lands, especially in Cedar and Benton Counties, and in Lawrence and Jasper Counties. It was one of the worst floods in many years in that part of the State, and the damage was heavy. Railroads were damaged by washouts; and crops were totally destroyed in the narrow valleys. Loss was heavy but no estimate in dollars and cents was obtainable.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem. R. F. D. No. 5. ‡ Indicates plus.

Daily Precipitation for August, 1927

VOL. XXXI. COLUMBIA, MO., SEPTEMBER, 1927. No. 9.

GENERAL SUMMARY.

September, 1927, in Missouri, was a month of quite varied and unusual weather, which ranged from one extreme to another. Excessive heat prevailed over the whole State the first seventeen days which abruptly terminated into a real cold snap that resulted in temperatures approximating the light freezing and frost values generally on the 21st, and 22d. The damage, fortunately, was confined to the most tender vegetation and in only a few scattered localities. As a climax following the change from heat to cold the month closed with general storms of marked intensity over nearly all the State, resulting in heavy to excessive rains which in turn caused the smaller rivers and many creeks to flood adjacent bottoms and lowlands, doing considerable damage to crops. As a part of the general storm strong winds occurred at many points, and a few tornadoes developed in the southern, southeastern, and northern parts of the State, and one of these, the most disastrous in three decades or more centered its fury on the city of St. Louis during the afternoon of the 29th, leaving death, injury, and vast destruction in its wake. (For details see special article.)

September was the first month since April to furnish more than normal warmth. It was not only decidedly warmer than a normal September but slightly warmer than August, whereas that month usually is 5 degrees warmer than September. The period from about the 8th to the 17th, inclusive, was about the warmest of any corresponding period since 1888. In the three preceding summer months, June, July, and August, there were only nineteen days with temperatures of 90 degrees or higher, 11 of these being in July. In September there were thirteen days when the temperature reached 90 degrees or higher.

While the weather of September, following the very pleasant summer, caused much complaint from the side of personal comfort, especially the persistent heat of the first twenty days, the discomfort was offset by the marked advantages of the sun's warmth in hastening the maturity of crops particularly corn. September undertook to remedy, to a large extent, the harm that the preceding months had done to the State's principal crops. Never was a hot dry spell more timely.

TEMPERATURE.

The monthly mean temperature for the State, as based upon the records of 65 stations, was 71.6°, or 2.6° above the normal, and slightly warmer than the preceding month of August. The temperature excess was quite uniformly distributed over all parts of the State. Excessive heat prevailed the first seventeen days, with the afternoon values reaching and exceeding 100° on several days, particularly on the 15th, 16th, and 17th. This degree of heat is not unusual for the first half of September. Last year the month's maximum was 97°, but in 1925 was 110° the highest in 40 years. About half the Septembers in the past 40 years have experienced temperatures of 100° or higher in some part of the State. A marked change to cooler occurred on the 21st, and 22d, when there were sharp falls in temperature of 40 to 48 degrees and to minima approximating the light freeze and frost values generally over the State. Afternoon temperatures were 90° or higher on 13 days, and 100° or higher (102° being the highest) at eight stations on six days.

PRECIPITATION.

The average precipitation for the State, 103 stations reporting, was 3.71 inches. This amount agrees closely with the 56 years' average, but the distribution was not even, being nearly three times the normal in the southeastern section, while all other sections received less than the normal. While the rains were general and generous from the 3d to the 8th, there was not much rain afterward until the last six days of the month when it fell daily, and was persistent, general and heavy, and locally damaging, particularly in the southeast and parts of the southwest section. Amounts falling within twenty-four consecutive hours or less ranged from 2.58 inches to 6.37 inches, the latter amount falling at Dexter, Stoddard County, on the 30th. The greatest monthly total was 9.82 inches, at Sikeston, Scott County, and the next heaviest, 7.81 inches, fell at Centerview, Johnson County.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—26th.

Frosts, light.—19th, 20th, 22d, and 27th. Heavy.—20th, and 21st. Killing, confined to a few low places.—21st, and 22d.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson: of Gano, Salem, R. F. D. No. 5. ‡ Indicates plus.

ª, ᵇ, ᶜ, etc., indicate respectively 1, 2, 3, etc., days missing from the record. §§ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

WBO, St. Louis, 10-26-27—915.

Continued from Page 36.

Hail.—Small, no damage, 3d, 7th, and 30th.

Halos, lunar.—None.

Halos, solar.—1st, 2d, 6th, 7th, 8th, 9th, and 27th.

Thunderstorms.—1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th, 16th, 17th, 18th, 25th, 27th, 28th, 29th, and 30th.

SPECIAL STORM NOTES.

Sept. 5---A strong wind blew across St. Louis County from east to west about two miles south of Ferguson, on the Florissant Road. The wind seemed to travel in two paths, 50 feet wide and 150 feet apart, and apparently as straight-line winds. Seven oak trees, from 30 inches to 48 inches in diameter, and 100 years old, were blown down flat, uprooted in two straight lines, 600 feet long. No person was killed and none injured. Damage about $700.

Sept. 29.---This was a stormy day over nearly all parts of the State, with tornadoes developing here and there, and more or less violent thunderstorms and heavy rains. About 3 p. m. a small tornado-like wind swept across Ripley County, Mo., passing eastward in the vicinity of Doniphan. The wind seemed to be too high up to cut any clean path on the ground and only did damage here and there, unroofing some houses, breaking windows, and damaging crops, along an irregular path about ten miles long and one-fourth to one mile wide. No persons killed or injured. Damage to buildings, etc., $300; crops, $1,000.

A little later, about 4 p. m. or 4:30 p. m. a tornado moved into Butler County from Arkansas, west of Corning. It passed northeast over the village of Brosely, Butler County. It struck several communities, Brosely being the largest, in a path nearly 30 miles long, starting in the southwest corner of Butler County. The width varied from one-half mile down to 200 to 300 feet, the line of damage being distinct and greatest where the path narrowed down. A score of persons was reported injured, but a check up brought the number down to 11, and one killed, and this one by lightning just preceding the wind. Ten or twelve houses, including dwellings, barns, and schoolhouse, were wrecked or partly wrecked, the damage being estimated at about $15,000. Strong wind was felt at Butler, but without damage, and in Stoddard County the storm spent its fury in a downpour of rain. Strong winds caused some alarm but no damage as far west as Laclede County and north to St. Francois County, and still farther north in Linn County, where in the vicinity of Brookfield another tornado developed and traveled a short distance from southwest to northeast, tearing down one barn, worth about $400, but doing no other damage.

The most disastrous storm of this altogether stormy day, and reported to be the greatest natural disaster that has befallen the city in 31 years, struck and tore a diagonal path through St. Louis, laying waste one-sixteenth of the city's area, doing damage to the extent of considerably more than $22,000,000 and killing 72 people and injuring hundreds. (See more detailed report).

THE ST. LOUIS TORNADO OF SEPTEMBER 29, 1927.

By Montrose W. Hayes, Meteorologist, U. S. Weather Bureau, St. Louis, Mo.

On September 29, 1927, at 1.00 p. m., a tornado moved across St. Louis, passed over the Mississippi River, and dissipated in Illinois, about three and one-half miles from the river.

The weather map for 7 a. m., September 29, showed a barometric depression of considerable intensity over Nebraska and Kansas. Special observations at 1 p. m., the time of the occurrence of the storm, made in the Missouri and upper Mississippi Valleys, placed the center of the depression in western Iowa, exactly to the northwest of St. Louis, and 350 miles distant.

In St. Louis the day broke cloudy and rainy. Intermittent rain that began before daylight ended at 7.10 a. m. After the ending of the rain strato-cumulus clouds predominated, but during the forenoon the ceiling was broken and some alto-stratus clouds were visible. The sun shone for 25 minutes between 8 and 9 a. m. Shortly after 11 a. m. clouds became lower and thicker, and rain began at 11.26 a. m. The rain was quite light for slightly more than an hour and a half. Low clouds were moving very rapidly from the southwest. At 12.41 p. m. lightning was seen and thunder was heard in the west. The thunderstorm rapidly overspread the west and southwest, and appeared to move to the northeast, its path being to the west of the Weather Bureau office. At 12.57 p. m. the clouds were very low, thick and black. One large detached portion was particularly noticeable; it seemed very little above the high buildings and from the Weather Bureau office it was west of and slightly to the south of the Bell Telephone Building. Although this detached cloud was quite black and angry-looking no boiling motion was apparent. The rain became heavy, in a sudden downpour, at 1.02 p. m., and the wind had increased to a very high velocity by 1 p. m. The low clouds, and the rain driven by the high wind, made a solid impenetrable grayish-brown mass outside the office windows (looking to the south and west) and vision from the windows was totally obscured from 1.02 p. m. to about 1.05 p. m., when the atmosphere grew lighter. The wind force decreased materially at 1.05 p. m., but the rain continued heavy until 1.13 p. m. A special observation was begun at 1 p. m., but on account of the dark deluge of water through the instrument shelter the instruments could not be read; they were eventually read at 1.06 p. m.

The wind was strong from the southwest after 6 a. m.; at 12.35 p. m. it backed to the south, but occasionally veered to the southwest, and was not quite so strong. At 12.56 p. m. it came steadily from the south and increased in force. At 1.02 p. m. it veered to the west, and blew from that direction until 1.06 p. m., at which time it became west-northwest. The maximum velocity was at the rate of 70 miles an hour in the 5 minutes beginning at 12.58 p. m., and the direction was mostly south. The extreme velocity was at the rate of 96 miles an hour from the west, beginning at 1.02 p. m.

The barograph trace fell steadily until 10 a. m., when the rate of fall increased, and at about 12.50 p. m. the fall became much more pronounced. At 1.02 p. m. there was an instantaneous fall from 28.91 to 28.80, and the fall was followed immediately by an instantaneous rise to a reading of 29.02. The trace then fell steadily till 4.00 p. m., after which it remained almost stationary, with slight fluctuations, until 6.15 p. m., when a rise set in and prevailed through the night. A barometer reading made at 1.10 p. m. gave the following results: Actual reading corrected for temperature of the mercury, instrumental error and gravity, 28.833 inches; reduced to the station elevation (568.2 feet, or 148.6 feet lower than the barometer), 28.988 inches; reduced to sea level, 29.59 inches. Another reading, made at 2.20 p. m., gave corresponding results as follows: 28.805, 28.960 and 29.56 inches.

At the Weather Bureau office the storm was severe, but there was no general damage in the immediate vicinity. Some plate glass windows were blown out, but the storm was not, at the time it occurred, considered more severe than heavy thunderstorms that occur from time to time. The Weather Bureau office is about one and three-fourths miles from the nearest edge of the tornado, as indicated by minor damage, and is about three miles from the center of the path of the tornado, as indicated by the greatest destruction.

The storm apparently originated in the extreme southwest portion of St. Louis, and moved in a northeast direction to the neighborhood of Tower Grove and Vandeventer Avenues, a distance of four miles. Thus far the path was about 300 feet wide and the damage was in spots. There is considerable doubt about the progress of the tornado beyond Tower Grove and Vandeventer Avenues. It either bent northwestward or dissipated and another storm formed on Manchester Avenue, just to the west of Kingshighway, slightly more than one-half mile northwest of the path of the original storm. From Manchester and Kingshighway, across the extreme southeast corner of Forest Park, then northeastward to West Park and Taylor, a distance of three-fourths mile in a northeasterly direction, there was sporadic wreckage over a path about 300 feet wide. Then the path widened, the storm became violent and the damage became general.

The fact that the original storm appears to have moved in a path parallel, near its terminus, to what may be called a second path, which had its origin near Manchester Avenue and Kingshighway, coupled with the observations of Dr. Clifford H. Farr, Professor of Botany, Washington University, would seem to indicate that it was a second and more violent formation that caused the great damage and loss of life. The notes of Dr. Farr's observations follow:

"At one o'clock on September 29th I was waiting in the corridor on the second floor of Barnes Hospital, looking out of the north windows at the clouds. The impression which I gained by the increasing darkness was of an impending storm of some severity. I therefore stepped into a vacant room, No. 2422, in order to see the storm to the south. The window of the room was raised about eighteen inches. It commanded a view south across Kingshighway (where it runs east and west) and into Forest Park in a direction parallel to the Taylor car line. The north and south stretch of Kingshighway and the car line were, however, not in view because of a wing of the hospital.

"Upon entering the room I heard a sound as of an approaching train. Gusts of wind blew through the room. I went to the window to close it. As I did so the sound grew still louder, becoming a terrible roar. A dense dark cloud was resting in Forest Park. I could see across the street and some trees on the other side, but I felt that I could not see more than a block distant.

"Then suddenly the scene changed. Out of this dark cloud there was organized a funnel. Judging its distance to be a block, I estimated its base resting on the ground as about two hundred feet in diameter, its height about twice that of the hospital, that is, that of an eight story building, and its diameter at the top as about four hundred feet. After looking over the ground since the storm I have concluded that I visualized the funnel as nearer to me than it really was. Such a mistake would be easily made in an atmosphere of that foggy type. Now I think that the funnel when I first saw it was about three blocks away. In other words I probably saw it just as it was toppling over the Bates statue. In this case the funnel must have been about six hundred feet in diameter at the base, and twice as wide at the top and perhaps eight hundred feet high.

"Autos were running to and fro on the boulevard between me and the cloud. The trees along the street were being blown, but did not bend greatly. I marveled at so little disturbance of the trees. The funnel moved toward me; I thought directly toward me. As it approached I could see streaks in the cloud. Its outline was very sharp and clean cut. Presently I saw boards and other objects coming out of the top of the funnel or near its upper margin. These must have come from the tennis courts which it crossed after leaving the statue. I felt that it was coming straight toward the hospital. The screen on the window was pulled loose by the suction. This distracted my attention from the funnel for a moment; and when I looked again the funnel was gone, I knew not whither. It must have then crossed Kingshighway to the Shriners' Hospital which was not in sight from my window.

"In place of the funnel, however, I saw the trees bending toward the east, before the most terrific wind that I have ever witnessed. The trees were almost horizontal; some of them were laid flat permanently. No cars were now being driven in the street. I expected to see the parked cars move, but I could not detect them doing so.

"Almost immediately I heard windows in the hospital crash. One of these was a north window through I had been looking in the corridor before I entered the room. It crashed in. Then the blow was over.

"Evidently the funnel had passed to the east of us and the strong west wind which bent the trees and then broke the glass was blowing directly toward it.

"I have not made a careful study of the trees in the devastated area. However, casual observations while crossing it on Delmar, Lindell and Pine make me think that the storm may have continued throughout its course much as I saw it. It appears that in an area about one and one-fourth blocks wide that the trees are not uprooted but are twisted off above ground and the tops and debris carried away. To the west of this area there is a zone of progressively less destruction for a distance of five or six blocks in which the trees are blown to the east, as if by a west wind, and the trees, branches and debris are left in the street. To the east of the area the margin of progressively less destruction seems to be considerably narrower.

The path was almost due southwest to northeast from West Park and Taylor to the southeast limits of Granite City, Ill., where surface conditions of the whirling motion disappeared. There was general destruction over a path two and one-half miles long and in places three-eighths mile wide, but scattered damage occurred in a zone somewhat more than one and one-fourth miles across at its widest place, which was from Olive and Spring northwest to Easton and Newstead. At Grand and St. Louis Avenues the path narrowed considerably and the destructive action became much less general. Then on to the northeasterly end of the path, in Illinois, the wreckage was not widespread. In fact, it seems that over this portion of the path, the tornado's tube was not continuously in contact with the ground, but the winds, which were not markedly of a whirling nature, were excessively high. An interesting phase of the storm was the finding of papers in Hillsboro, Litchfield and Mt. Olive, Ill., that belonged to people in the devastated area of St. Louis. These towns are 40 to 50 miles northeast of a point just north of the McKinley bridge across the Mississippi, where the storm crossed the river. The papers seemed to have dropped from the sky.

The time taken in the passage of the storm from southwestern St. Louis to the southeast of Granite City, in Illinois, is not known. All reports of first damage in St. Louis place the time "about 1 p. m." An instantaneous drop and rise in the barometer trace in the Weather Bureau office (one and three-fourths miles southeast of the nearest edge of the storm, and 3 miles from the center) took place at 1.02 p. m., and the extreme wind velocity (96 miles an hour) was at the same time. Reports from the Illinois side of the river, place the time of the storm "a few minutes after 1 p. m."

A comparative analysis of the storm would be impossible, but judging from the reports of the character of destruction and from the pressure falls recorded by the nearest barographs, this tornado was not as violent in a meteorological sense as the St. Louis tornado of May 27, 1896, and the southern Illinois tornado of March 18, 1925. Destruction of life and property is obviously no criterion of the relative severity.

In St. Louis 72 people were killed; of this number several died of injuries some days after the storm. The injured numbered around 500. Fortunately, there were few fires following the storm, but several persons (not included in the 72) were killed while at work in the wreckage. In Illinois several people were killed and one man died of heart failure; there were about 50 injured.

The monetary damage is, of course, not definitely known, and probably never will be. A careful survey in St. Louis indicates that, exclusive of motor cars and the contents of buildings of whatever nature, the damage amounted to $22,000,000. In Illinois the total damage was probably less than $3,000,000.

Minute examinations are being made of the classes of construction in the storm's path. Valuable lessons will be learned from the experience, but no definite conclusions have been reached yet. Photographs of buildings in the storm zone show the major damage was suffered by old residences and flat buildings. Two modern apartments near the center of the path suffered minor damage, consisting largely of blown-off parapet walls and blown-out windows. Industrial plants suffered great damage. In all damaged buildings near the storm's center an explosive effect was plainly marked.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXXI. Columbia, Mo., October, 1927. No. 10.

GENERAL SUMMARY.

October, 1927, in Missouri, was, for the most part a very pleasant fall month, with typical "Indian Summer" weather prevailing. However the series of general storms that were in progress at the close of September continued into October and were the outstanding features over practically all the State on the first two or three days. During this stormy period unusually heavy amounts of precipitation occurred widely, save the extreme southeast part, the greater part of the monthly total rainfall being recorded on the first two days. From the 12th to the 30th made up a period of unusually warm, dry, and clear weather that embraced the entire State and day after day the sunshine was 90 to 100 per cent of the possible. This prolonged type of fine weather was of great economic value to the people of the State of Missouri. It made up largely what the late summer lacked good maturing weather for late crops, and practically all crops were late. The absence of any general killing frost permitted an unusually long growing season and by the close of the month all seasonal farm crops and activities were excellent and well advanced.

The month was one of the warmest of record, and the last six or seven days were the warmest of any similar period in October in 40 years. While the month averaged near two inches wetter than normal it was in fact relatively a dry month because nearly all the water fell during the first few days and the last day. After the 12th there were seventeen consecutive days without rain and very little cloudiness.

Aside from some small damage by wind and water the first day or two the month was free from both hail and severe windstorms.

TEMPERATURE.

The mean temperature for the State, as shown by the records of 66 stations, was 60.9°, or 3.5° higher than the normal, and the distribution was remarkably uniform. There was no general killing frost but on the 14th, 18th, and 19th rather general and heavy deposits were recorded and locally at a few stations killing frosts were reported on those dates. The resulting damage, however, was small. Summer warmth prevailed the last week or more of the month. Maxima of 90° to 93° were general on the 23d, 24th, 25th, and 27th, and exceeding the record for so late in October. The minimum reached 32° or lower at eight stations on 4 days in the northeast plain; four stations on 2 days in the southeastern lowlands; nine stations on 7 days Ozark Plateau; two stations on 2 days southwestern plain, and at three stations on 4 days in the northwestern plateau.

PRECIPITATION.

The average precipitation for the State, 101 stations reporting, was 4.72 inches, or about 1.97 inches more than the 56 years' average, and the third consecutive October with a large moisture excess. The records are somewhat misleading because most of the month was dry and fine. Practically all of the rain occurred the first ten or twelve days, and much the greater part of the total fell on two days. the first and second. While limited to a few days monthly totals were excessive in most of the State, over 10 inches being recorded at Kirksville and Chillicothe, and over 9 inches at Amoret. The heaviest 24 hour amount ever recorded in October occurred at Amoret, 8.85 inches falling on the 1st, while the second heaviest amount, 6.15 inches, fell at Chillicothe on the same date, and also 5.81 inches at Gorin. Bright sunshiny weather prevailed from the 13th to the 29th.

MISCELLANEOUS PHENOMENA.

Aurora.---At Warrenton on the 22d.

Fogs, dense.---8th, 9th, and 14th.

Frosts, light.---4th, 8th, 9th, 10th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, and 31st.

Frosts, heavy.---1st, 3d, 14th, 18th, and 19th.

Frosts, killing.---Locally on the 14th, 18th. and 19th.

Hail, small.---Eldon on the 1st; Conception 6th; Fulton, Neosho, Seligman, 11th; Seymour, 12th.

Halos, lunar.---6th Solar.---23d, 24th, 25th, 29th, and 30th.

Thunderstorms.---1st, 2d, 3d, 5th, 6th, 7th, 11th, 12th, 30th, and 31st.

SPECIAL STORM NOTES.

Between midnight of October 2 and 2 a. m. of the 3d a strong wind entered the extreme southwest part of Missouri, coming from Kansas, thence northeast over the western part of McDonald and through the central part of Newton County. Most of the reports indicated a strong straight blowing wind, but in the vicinity of Neosho, Newton County there was some evidence of a tornado whirl. No injury to persons or livestock was reported. Loss to buildings, etc. about $4,300; crops, $1,000.

Oct. 3.---A. T. Crouse, farmer, six miles south of Cameron was killed by lightning.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

VOL. XXXI. COLUMBIA, MO., NOVEMBER, 1927. No. 11.

GENERAL SUMMARY.

November, 1927, in Missouri, averaged warm, cloudy, and wet, except as to the last element in the northwestern plateau. In its leading temperature features November was much like October, especially as to the unusual and persistent warmth during the last ten days of both months. The distribution of precipitation and cloudiness, however, was decidedly different, most of October being sunshiny and fine.

November opened very warm but a cold spell followed immediately, resulting in the first killing frost and general freeze on the 6th, and about 20 days later than the average. After the first week and up to about 19th the weather was variable but mainly cool. The last nine or ten days were warm.

The rainy spells were about a week apart, the most notable probably being on the 8th, 14–15th, and 29–30th. While November precipitation was somewhat more generous than needful there was no harm done. The first general snow of the season prevailed on the 30th. From about Pettis and Saline east to Warren thence to Marion County total depths ranged from 3 to about 5 inches. Over the remainder of the State the falls were light, most of it melting about as fast as it fell or soon after falling.

The month's weather was not markedly unfavorable for outdoor pursuits, though most work was temporarily stopped or interfered with by rather too much rain and excess cloudiness. There were some adverse effects on the heavy clothing lines of business, as indicated by reduced sales. The wheat crop is well rooted and enters the winter in satisfactory condition.

TEMPERATURE.

The mean temperature for the State, as shown by the records of 67 stations, was 46.8°, or 2.3° higher than normal. The excess departure from the usual November normal was quite marked and uniform in all parts of the State, save in the northwestern section where it was less than 1°. Except on the 1st, 10th, and 14th, temperatures were generally below normal the first 20 days, but the last 10 days were unusually mild. On the warmest days the maxima ranged well up into the 80's generally. The coolest spells prevailed on the 6th, 7th, and 18th, and the minima reached 32° or lower on an average of 13 days. There was no zero cold.

PRECIPITATION.

The average precipitation for the State, 99 stations reporting, was 3.55 inches or about 1.20 inches, more than the 56 years' average. It was the wettest November since 1922, except in the northwestern section. The greatest monthly amount was 7.89 inches, at Rolla. The greatest 24-hour amount was 3.41 inches, at Rolla on the 29th. Precipitation was more or less general only on the 2d, 7th, 15th, 23d, and 29th.

A more or less general snowstorm prevailed on the 30th. The average depth for the State was 0.9 inch. Over the central and east-central counties depths ranged from 3 to 5 inches.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—8th, 9th, 10th, 23d, and 28th.
Frost, first general killing.—On the 6th.
Halos, lunar.—4th, 5th. Solar.—2d, 4th, 14th, and 24th.
Sleet, light, without damage.—5th, 7th, 16th, and 30th.
Thunderstorms —1st, 2d, 7th, 11th, 14th, 15th, 23d, 27th, 28th, 29th, and 30th.

SPECIAL STORM NOTES.

Nov. 1—General thunderstorms, accompanied by squalls and local hail, caused some damage. At Columbia, Boone County, the hail was heavy and large, especially over the western and northern parts of the city. The damage was confined to window glass breakage, roofs of houses, and automobile tops. One floral company had 1,900 glass panes broken. The breakage also was considerable to other business concerns as well as homes. Wire service companies as well as some small out buildings were damaged by the wind. The loss by hail was estimated at $6,000; by wind, $1,000. During the same afternoon hail caused some damage in the southern part of Webster County; damage about $800.

Strong winds, reaching nearly gale force at times, were quite general on the 10th, 11th, and 30th, and locally on the 7th, 16th, 21st, and 22d. There was no material damage.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, ^{a}, ^{b}, ^{c}, appearing in the table indicate number of days missing; for example, ^{b}, represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson.

Daily Precipitation for November, 1927

VOL. XXXI. COLUMBIA, MO., DECEMBER, 1927. No. 12.

GENERAL SUMMARY.

Following the unusual mild weather of October and November, December, 1927, was mostly cold in all of Missouri, although, save two spells of the "blizzard" type, the prevailing weather possessed those physiological qualities popularly known as snap and vigorousness.

The first five days were cold generally, followed by a spring-like day on the 6th. An abrupt change to a cold wave on the 7th, that overspread the State to the southern limits by the 8th, with some snow and wind, and zero and subzero cold, the lowest being −11° at one station. After this and up to about the 25th, the month was mainly cold, though marked by open skies and some changeable temperature conditions. After the 25th there were a few days warmer than normal, but this spell was abruptly ended by another cold wave on the 30th-31st, attended by heavy snow and strong westerly to northerly winds. This cold wave was strongly felt to the southern border, the lowest temperature being 5° above, and in central and northern counties 9° below zero, though the center of cold had not reached Missouri by midnight of the 31st. The snow was fine and relatively dry, and drifted badly, piling up considerable depths in depressions and in the more or less protected places, while many open fields were swept practically bare of snow. From northward to the Ozarks practically all railroad and highway traffic was interrupted and very nearly demoralized for the time being. And automobile accidents on the main highways were numerous and serious.

The usual farm work was well in hand. Rough feed was plentiful. Winter wheat was covered with snow during some of the coldest weather and the condition was generally satisfactory. Some adverse effects were observed in the automobile business, but food and clothes were active.

TEMPERATURE.

The monthly mean temperature for the State, based upon the records of 66 stations, was 29.9°, or 4° below the normal. It was the coldest December since 1924. There were two rather severe cold waves, the first on the 7th-8th, and the second on the 30th-31st. The first 20 days or more were mainly cold but the 6th, 12th, 13th, and 14th were quite pleasant days, while from the 26th to the 29th mild weather was most in evidence. The first cold wave brought zero and subzero temperatures to much of the State, as well as the second one, though the latter was more general and widespread. The morning of the 8th and 31st were the coldest, when minima ranged from 5° to 10° below zero from the northern border to the Ozarks and 5° to 10° above zero on the southern border. There were 24 to 28 days with minimum of 32° or lower, and 1 to 3 days with zero or lower. During the afternoon of the 13th maxima ranged from 65° to 74°.

PRECIPITATION.

The average precipitation for the State, 98 stations reporting, was 2.68 inches, or about 0.65 inch more than the 56 years' average. The northwestern plateau was a little drier than normal, while the other sections were wetter. General precipitation occurred on the 7th, 13th, and on the last 4 days. Some excessive amounts fell in the southeast on the 13th, namely, 5.65 inches at Koshkonong, 4.30 inches at Birchtree, 4.12 inches at Marble Hill, and more than 2 inches at several other stations The Eleven Point River went out of banks. The first 5 or 6 days and from the 16th to the 26th were generally without rain.

The snowfall for the State averaged nearly 3 inches. Over most of the central counties depths were 6 to 9 inches, and somewhat less to the north and south, with only a trace along the southern border. There were two snowstorms, one on the 7th-8th and the other 30th-31st. The latter gave the most general and heaviest amounts, and, being attended by high winds, drifted to considerable depths, resulting in delayed railroad and highway traffic and demoralized business generally.

MISCELLANEOUS PHENOMENA.

Fogs, dense.—7th, 11th, 12th, 13th, 14th, 24th, 25th, 29th, and 30th.

Halos, lunar.—1st, 7th, 29th, and 31st.

Halos, solar.—1st, 6th 14th, 21st, 22d, 26th, and 31st.

Sleet, light and local, without damage.—10th, 11th, and 30th.

Strong winds to gales occurred on the 7th, 15th, 30th, and 31st. No damage, except suspended traffic on 30th-31st, by drifted snow, and automobile accidents on highways.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b], represents two days, etc.

†Also on other dates. ††Received too late to be included in means and summaries. ‡‡Post-office addresses of these stations are as follows: of Dean, Anderson.

MISSOURI SECTION.

GEORGE REEDER, Meteorologist.

Vol. XXXI. Columbia, Mo., Year, 1927. No. 13.

GENERAL SUMMARY.

For the State of Missouri, as a whole, the year 1927 was slightly warmer than normal, the annual mean temperature being 55.5°, but with 53.86 inches, it was the wettest on record of 60 years, the year previously holding the record for wetness being 1898, with 53.67 inches. It also was a year unprecedented in the number of damaging storms, and the severity and extent of territory affected. In addition to the foregoing, the year 1927 will long be remembered for its disastrous floods, and especially in the southeastern lowlands.

Eleven tornadoes killed 174 persons, injured 870 others, and caused property damage approximating $25,000,000, about $23,000,000 occurring in St. Louis City alone. Thirteen severe hailstorms caused more than $1,000,000 property damage other than crops, and approximately $500,000 to growing crops. Destructive winds, other than true tornadic winds, resulted in another $1,136,500 in damage and loss. A grand total exceeding $28,000,000, when we include some other items in a summarized table on page 58.

February, March, and April, September, October, and November were warmer than normal. January and May averaged about normal. June, July, August, and December were colder than normal. All months were wetter than normal, except February and September. October's wetness was largely confined to the first three days. February was the warmest in 40 years. A late April frost was severely damaging to the fruit crop. The rains were excessive from about the middle of March to the middle of June, with only short intervals of favorable weather. May was unusually stormy. The summer, June, July, and August, was distinctly cool. The autumn was quite ideal and just the kind of weather needed for late crops.

In spite of the fact that at the end of June the planting season was the most delayed in 40 years, possibly with the exception of 1896; and in spite of other harmful weather conditions enumerated in the foregoing, nearly all crops fully matured to good yields. This was largely brought about, however, by the persistent favorable weather of September and October, September alone furnishing nearly as many real hot days as the preceding three months combined, and the long growing season that did not end until November 6, being from 10 to 20 days longer than the average.

Temperature.—The annual mean for the State was 55.5°, or 0.7° above the normal. The highest annual mean was 59.9°, at Koshkonong, Oregon County. The lowest annual mean was 51.6°, at Tarkio, Atchison County The highest temperature was 102°, at Marshall, Saline County, Sept. 17th. The lowest was −24°, at Chillicothe, Livingston County, Jan. 15. The annual range for the State was 126°.

Precipitation.—The annual fall was 53.86 inches, or 14.99 inches more than normal. The greatest local annual amount was 82.67 inches, at Morehouse, New Madrid County, 36 inches more than normal. The least annual amount was 30.71 inches, at Tarkio, Atchison County, about 4 inches more than normal. The seasonal snowfall was 13 inches, about as follows: 14 inches in the northwest section, 17 in the northeast, 7 in the southeast, 9 in the Ozark hills, and 18 inches in the southwest section. The greatest local annual fall was 28 inches, at Lamonte, Pettis County.

THE WEATHER BY MONTHS.

January.—The first 10 or 12 days were relatively mild and dry. The remainder of the month, save the last four days, was mainly cold and wet, the pleasant first part of the month being abruptly changed by a widespread and severe cold wave on the 14th and 15th. Subzero temperatures were general, the minimum being −24°, and the lowest since 1924. The snowfall was less than normal. Damaging floods, sleet and glaze occurred in the extreme southeast counties 18th to the 23d. Winter wheat was mostly dormant. The cold weather prevented premature fruit bud swelling. There was some local damage.

February.—Unusual and persistent warmth, and not more than one-half the normal precipitation. The warmest February in 40 years. Two rather heavy snows occurred, one on the 9th and the other near the end of the month. Some local blockading of traffic occurred. The weather was favorable for winter grains and outdoor work. It was too warm for fruit trees and caused premature swelling of the buds. Much plowing was done, and oats and clover sown. Winter wheat looked well.

March.—This month was also very mild, and besides it was notable for excessive precipitation, frequent thunderstorms, and much hail. There was very little snow. Winter wheat was damaged in the lower lands by high water. All grains responded quickly to the warmth and moisture. The main highways were damaged by water. The farm roads were impassable; and the wet weather rather adversely affected general business. There was no farm work after the tenth.

April.—The wettest April in 60 years, and only a few in past years were warmer. There was only one cool spell and it prevailed from about the 20th to the 25th. It was attended by general frost and freeze and resulted in severe damage to most tree and bush fruits, and early gardens, and to some early planted corn. Thousands of acres of valuable river bottom lands were submerged for relatively long periods. Farm work was at a standstill. The State Highway workers were much handicapped by the continuous rains; and railroads had quite frequent delays by washouts. Farmers had to take to horseback and horse-drawn vehicles to get to the main highways. Wind and hail caused much damage over considerable areas.

May.—A month to be remembered for excessive cloudiness and precipitation, severe river floods, destructive winds and hail, and consequent heavy loss in property as well as lives. The lack of sunshine made the month unpleasant from the side of personal comfort, and the constant necessity for furnace warmth brought forth frequent public remarks that the month was more like March than May. Most unfavorable for farm work, and all vegetation, save grasses. Not more than 60 per cent of corn had been planted at the end of the month. The most backward season in many years.

June.—A very cool month, and wet up to about the 20th, when rains abruptly ceased. The last ten days were bright and warm, the first real touch of summer. Field work made advance during the last 8 or 10 days, but the season was fully three weeks behind. Much corn was just coming up and some being planted. Small grains were injured by the wet weather, as well as nearly all fruits that escaped the April freeze. Some severe local hail and wind damage.

July.—Cooler than normal but the rainfall, sunshine, and winds approximated the usual for July. An ideal summer month from the physiological side; and the most favorable for crop growth since the opening of the season. The unusual backward condition of the corn crop was largely overcome. Wheat, oats, and hay harvest was completed under especially

(Continued on Page 58.)

SUMMARY—*Continued from Page 54.*

favorable skies. Plowing for fall seeding was well advanced much ahead of the same work last year. There were a few local hail and wind storms.

AUGUST.—Distinctly a cool summer month. About 5° cooler than normal and about 2° warmer than a normal September. It also was the sixth consecutive month wetter than normal. It was not as cool on the average as the same month in 1915, but it was the second August in 40 years during which the value 100° was not recorded in some part of the State. Corn made slow advance, and full and good maturity depends much upon favorable weather in September and October. There was some local flood damage but no hail or strong winds.

SEPTEMBER.—A month of varied and unusual weather, though largely favorable. There was much bright sunshine and persistent heat the first 20 days, when September undertook to remedy, to a large extent, the harm that the preceding so-called summer months had done the State's principal crops. There was an abrupt change to nearly winter, light freeze and frost being general on the 21st, and 22d. As a climax the month closed with general rains and storms of marked intensity. On the other hand September was the first month since April to furnish more than normal warmth. There were 13 days with temperature 90° or higher. June, July, and August gave a combined total of 19, 11 occurring in July.

OCTOBER.—In nearly every respect an ideal crop maturing month and just the weather needed. The warmest October on record. The rainfall was excessive the first three days, the storm extending over from September. Fine weather followed and persisted to nearly the end of the month. There was no hail or wind damage. Winter wheat sowing was completed in fine shape.

NOVEMBER.—Averaged cloudy, warm, and rather wet. The first general killing frost and freeze occurred on the 6th, about 20 days later than the average, giving a growing season of about 197 days, 12 days longer than the average. Corn husking as well as other outdoor occupations were interrupted by the rainy spells. The wheat crop was well rooted and in good winter condition.

DECEMBER.—Mainly cold, but much fine open weather. Two cold waves were the outstanding features, the first about the 7th, and other at the end of the month, the latter being attended by high wind and heavy snow. There was considerable highway traffic trouble, caused by snow drifts. The seasonal farm work was well in hand. Winter wheat was covered with snow during lowest temperatures.

SUMMARY OF APPROXIMATE STORM DAMAGE IN MISSOURI, 1927.

JANUARY.—Heavy continued rains from the 18th to the 24th over the extreme southeast part of Missouri, followed by severe sleet and glaze caused much loss and suffering. Owing to the season the loss and damage could be only partly estimated ----- $70,000

FEBRUARY.—A heavy snowstorm on the 9th, and again on the 27-28th, the latter being confined mostly to the western part of the State, caused expense and stoppage to traffic ----- $5,000

MARCH.—Hail fell on ten days and was widespread, although not on any one day. In some instances the stones were as large as black walnuts. Damage put at ----- $3,200

APRIL.—Hailstorms were numerous. Over the northern half of the State, both hail and wind caused much loss ----- $10,500
Two tornadoes occurred on the 19th. One traveled from Boone County to Audrain. Damage and loss about ----- $60,000
The other developed in Lincoln County, thence over the Mississippi River into Illinois. Loss about ----- $18,500

MAY.—An unusually stormy month. Besides many hailstorms, floods, and excessive rainfall, there were five tornadoes, two being unusually severe. Loss by hail ----- $1,478,000
By tornadoes and other winds ----- $3,800,000

JUNE.—On the 3d severe hail occurred over the northern section, preceded or attended by high winds, especially in Linn and Marion Counties. Damage by wind ----- $56,000
By hail, stones averaging one-half inch, diameter ----- $100,000
On the 19th severe wind and hail in the vicinity of Joplin, Jasper County. Damage by wind ----- $8,000
By hail, some large stones ----- $2,000

JULY.—On the 6th and again on the 24th hail damaged crops in Nodaway County to the extent of ----- $75,000
On the 6th there was wind damage in the City of St. Louis ----- $16,000
On the 13th hail damage crops in Gentry County ----- $30,000
On the 28th a small tornado passed through a part of Kansas City, Mo., damaging property to the extent of ----- $25,000

AUGUST—Excessive rains on the 14th and on the 16th caused the smaller rivers and creeks of the southwest part of the State to overflow the lowlands, resulting in much crop damage, estimated about ----- $20,000

SEPTEMBER.—On the 5th a local high wind did some damage in St. Louis County, on the Florissant Road ----- $700
On the 29th small tornadoes damage property in Ripley, Butler, and Linn Counties. Loss to buildings ----- $15,700
To crops, breaking fruit trees, etc ----- $1,000
The most disastrous tornado for many years struck St. Louis City at 1:05 p. m. the 29th. Loss ----- $22,000,000

OCTOBER.—On the 2d and 3d damaging winds occurred in parts of McDonald and Newton Counties. Loss to buildings ----- $4,000
To crops, hay ricks and corn shocks ----- $1,000

NOVEMBER.—On the 1st, severe hail and high wind caused damage at Columbia, Mo. Destruction by hail to roofs, glass, and automobiles ----- $6,000
By wind to roofs, chimneys and trees ----- $1,000
In Webster County near Seymour, by hail ----- $800
On the 15th near Willow Springs, Howell County, wind damage ----- $500
To crops by wind ----- $200

Grand Total ----- $28,483,100

Evaporation Table, Columbia, Mo.

* Observations taken at 6:45 a. m.

NOTE:—As evaporation records have been made ten years, long enough to meet needs, Station No. 2 (Mo. Experimental Farm) was discontinued at the close of 1926 season, and Station No. 1 (Weather Bureau) at the close of 1927 season. Data are published in Annual Climatological Summaries 1917 to 1927, inclusive.
